

# $\beta^{**}$ Generalized Connectedness in Intuitionistic Fuzzy Topological Spaces

## 6.1 Introduction

Raja Sethupathy and Lakshmivarahan (1977) have introduced the concept of connectedness in fuzzy topological spaces. Connectedness in intuitionistic fuzzy special topological spaces was introduced by Ozcag and Coker (1998). In this chapter we have introduced intuitionistic fuzzy  $\beta^{**}$  generalized connected space, intuitionistic fuzzy  $\beta^{**}$  generalized super connected space and intuitionistic fuzzy  $\beta^{**}$  generalized extremely disconnected space. Also we have provided some characterizations of intuitionistic fuzzy  $\beta^{**}$  generalized super connected spaces.

## 6.2 Intuitionistic Fuzzy $\beta^{**}$ Generalized Connected Spaces

In this section we have introduced intuitionistic fuzzy  $\beta^{**}$  generalized connected space and intuitionistic fuzzy  $\beta^{**}$  generalized super connected space. We have investigated some of their properties. Also we have provided a characterization theorem for an intuitionistic fuzzy  $\beta^{**}$  generalized super connected space.

**Definition 6.2.1 :** An IFTS  $(X, \tau)$  is said to be an **intuitionistic fuzzy  $\beta^{**}$  generalized  $(IF\beta^{**}G)$  connected space** if the only IFSs which are both an  $IF\beta^{**}GOS$  and an  $IF\beta^{**}GCS$  are  $0_{\sim}$  and  $1_{\sim}$ .

**Proposition 6.2.2 :** Every  $\text{IF}\beta^{**}G$  connected space is an  $\text{IFC}_5$ -connected space but not conversely in general.

**Proof :** Let  $(X, \tau)$  be an  $\text{IF}\beta^{**}G$  connected space. Suppose  $(X, \tau)$  is not an  $\text{IFC}_5$ -connected space, then there exists a proper IFS  $B$  which is both an IFOS and an IFCS in  $(X, \tau)$ . That is  $B$  is both an  $\text{IF}\beta^{**}GOS$  and an  $\text{IF}\beta^{**}GCS$  in  $(X, \tau)$ . This implies that  $(X, \tau)$  is not an  $\text{IF}\beta^{**}G$  connected space. This is a contradiction to our hypothesis. Therefore  $(X, \tau)$  must be an  $\text{IFC}_5$ -connected space.

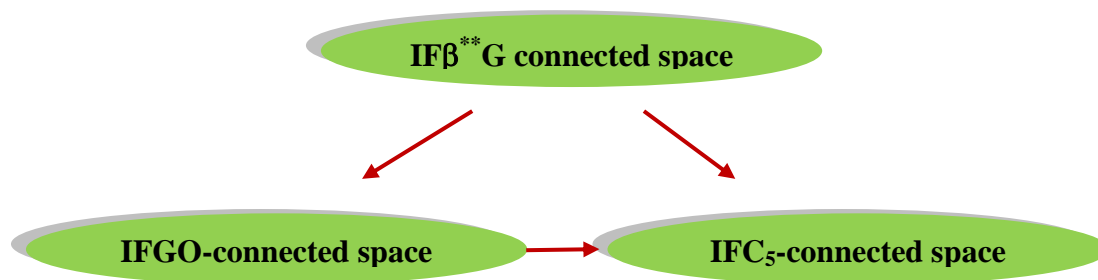

**Example 6.2.3 :** Let  $X = \{a, b\}$ ,  $G_1 = \langle x, (0.3_a, 0.3_b), (0.7_a, 0.7_b) \rangle$  and  $G_2 = \langle x, (0.7_a, 0.6_b), (0.3_a, 0.4_b) \rangle$ . Then  $\tau = \{0_-, G_1, G_2, 1_-\}$  be an IFT on  $X$ . Here  $(X, \tau)$  is an  $\text{IFC}_5$ -connected space but not an  $\text{IF}\beta^{**}G$  connected space, since the IFS  $A = \langle x, (0.6_a, 0.5_b), (0.4_a, 0.5_b) \rangle$  is both an  $\text{IF}\beta^{**}GOS$  and an  $\text{IF}\beta^{**}GCS$  in  $(X, \tau)$ .

**Proposition 6.2.4 :** Every  $\text{IF}\beta^{**}G$  connected space is an IFGO-connected space but not conversely in general.

**Proof :** Let  $(X, \tau)$  be an  $\text{IF}\beta^{**}G$  connected space. Suppose  $(X, \tau)$  is not an IFGO-connected space, then there exists a proper IFS  $B$  which is both an IFGOS and an IFGCS in  $(X, \tau)$ . That is  $B$  is both an  $\text{IF}\beta^{**}GOS$  and an  $\text{IF}\beta^{**}GCS$  in  $(X, \tau)$ . This implies that  $(X, \tau)$  is not an  $\text{IF}\beta^{**}G$  connected space. This is a contradiction to our hypothesis. Therefore  $(X, \tau)$  is an IFGO-connected space.

**Example 6.2.5 :** Let  $X = \{a, b\}$ ,  $G_1 = \langle x, (0.3_a, 0.3_b), (0.7_a, 0.7_b) \rangle$  and  $G_2 = \langle x, (0.7_a, 0.6_b), (0.3_a, 0.4_b) \rangle$ . Then  $\tau = \{0_-, G_1, G_2, 1_-\}$  be an IFT on  $X$ . Here  $(X, \tau)$  is an IFGO-connected space but not an  $\text{IF}\beta^{**}G$  connected space, since the IFS  $A = \langle x, (0.6_a, 0.5_b), (0.4_a, 0.5_b) \rangle$  is both an  $\text{IF}\beta^{**}GOS$  and an  $\text{IF}\beta^{**}GCS$  in  $(X, \tau)$ .

The relation between various types of intuitionistic fuzzy connectedness is given in the following diagram.

In the above diagram the reverse implications are not true in general.

**Proposition 6.2.6 :** An IFTS  $(X, \tau)$  is an  $\text{IF}\beta^{**}\text{G}$  connected space if and only if there exists no non-zero  $\text{IF}\beta^{**}\text{GOS}$ s  $A$  and  $B$  in  $(X, \tau)$  such that  $A = B^c$ .

**Proof : Necessity :** Let  $A$  and  $B$  be two  $\text{IF}\beta^{**}\text{GOS}$ s in  $(X, \tau)$  such that  $A \neq 0_{\sim}$ ,  $B \neq 0_{\sim}$  and  $A = B^c$ . Therefore  $B^c$  is an  $\text{IF}\beta^{**}\text{GCS}$ . Since  $B \neq 0_{\sim}$ ,  $A = B^c \neq 1_{\sim}$ . This implies  $A$  is a proper IFS which is both  $\text{IF}\beta^{**}\text{GOS}$  and an  $\text{IF}\beta^{**}\text{GCS}$  in  $(X, \tau)$ . Hence  $(X, \tau)$  is not an  $\text{IF}\beta^{**}\text{G}$  connected space. But this is a contradiction to our hypothesis. Thus there exist no non-zero  $\text{IF}\beta^{**}\text{GOS}$   $A$  and  $B$  in  $(X, \tau)$  such that  $A = B^c$ .

**Sufficiency :** Let  $A$  be both an  $\text{IF}\beta^{**}\text{GOS}$  and  $\text{IF}\beta^{**}\text{GCS}$  in  $(X, \tau)$  such that  $1_{\sim} \neq A \neq 0_{\sim}$ . Now let  $B = A^c$ . Then  $B$  is an  $\text{IF}\beta^{**}\text{GOS}$  and  $B \neq 1_{\sim}$ . This implies  $B^c = A \neq 0_{\sim}$ , which is a contradiction to our hypothesis. Therefore  $(X, \tau)$  is an  $\text{IF}\beta^{**}\text{G}$  connected space.

**Proposition 6.2.7 :** An IFTS  $(X, \tau)$  is an  $\text{IF}\beta^{**}\text{G}$  connected space if and only if there exists no non-zero  $\text{IF}\beta^{**}\text{GOS}$ s  $A$  and  $B$  in  $(X, \tau)$  such that  $B = A^c$ ,  $B = (\beta\text{cl}(A))^c$  and  $A = (\beta\text{cl}(B))^c$ .

**Proof : Necessity :** Assume that there exists IFSs  $A$  and  $B$  such that  $A \neq 0_{\sim}$ ,  $B \neq 0_{\sim}$ ,  $B = A^c$ ,  $B = (\beta\text{cl}(A))^c$  and  $A = (\beta\text{cl}(B))^c$ . Since  $(\beta\text{cl}(A))^c$  and  $(\beta\text{cl}(B))^c$  are  $\text{IF}\beta^{**}\text{GOS}$ s in  $(X, \tau)$ ,  $A$  and  $B$  are  $\text{IF}\beta^{**}\text{GOS}$ s in  $(X, \tau)$ . This implies  $(X, \tau)$  is not an  $\text{IF}\beta^{**}\text{G}$  connected space, which is a contradiction. Therefore there exists no non-zero  $\text{IF}\beta^{**}\text{GOS}$ s  $A$  and  $B$  in  $(X, \tau)$  such that  $B = A^c$ ,  $B = (\beta\text{cl}(A))^c$  and  $A = (\beta\text{cl}(B))^c$ .

**Sufficiency :** Let  $A$  be both an  $\text{IF}\beta^{**}\text{GOS}$  and  $\text{IF}\beta^{**}\text{GCS}$  in  $(X, \tau)$  such that  $1_{\sim} \neq A \neq 0_{\sim}$ . Now by taking  $B = A^c$ , we obtain a contradiction to our hypothesis. Hence  $(X, \tau)$  is an  $\text{IF}\beta^{**}\text{G}$  connected space.

**Proposition 6.2.8 :** If  $f : (X, \tau) \rightarrow (Y, \sigma)$  is an  $\text{IF}\beta^{**}\text{G}$  continuous mapping and  $(X, \tau)$  is an  $\text{IF}\beta^{**}\text{G}$  connected space, then  $(Y, \sigma)$  is an  $\text{IFC}_5$ -connected space.

**Proof :** Let  $(X, \tau)$  be an  $\text{IF}\beta^{**}\text{G}$  connected space. Suppose  $(Y, \sigma)$  is not an  $\text{IFC}_5$ -connected space, then there exists a proper IFS  $A$  which is both an IFOS and an IFCS in  $(Y, \sigma)$ . Since  $f$  is an  $\text{IF}\beta^{**}\text{G}$  continuous mapping,  $f^{-1}(A)$  is both an  $\text{IF}\beta^{**}\text{GOS}$  and an  $\text{IF}\beta^{**}\text{GCS}$  in  $(X, \tau)$ . But this is a contradiction to our hypothesis. Hence  $(Y, \sigma)$  is an  $\text{IFC}_5$ -connected space.

**Proposition 6.2.9 :** If  $f : (X, \tau) \rightarrow (Y, \sigma)$  is an  $\text{IF}\beta^{**}\text{G}$  irresolute surjection mapping and  $(X, \tau)$  is an  $\text{IF}\beta^{**}\text{G}$  connected space, then  $(Y, \sigma)$  is also an  $\text{IF}\beta^{**}\text{G}$  connected space.

**Proof :** Suppose  $(Y, \sigma)$  is not an  $\text{IF}\beta^{**}\text{G}$  connected space, then there exists a proper IFS  $B$  which is both  $\text{IF}\beta^{**}\text{GOS}$  and  $\text{IF}\beta^{**}\text{GCS}$  in  $(Y, \sigma)$ . Since  $f$  is an  $\text{IF}\beta^{**}\text{G}$  irresolute mapping,  $f^{-1}(B)$  is both  $\text{IF}\beta^{**}\text{GOS}$  and  $\text{IF}\beta^{**}\text{GCS}$  in  $(X, \tau)$ . But this is a contradiction to hypothesis. Hence  $(Y, \sigma)$  is an  $\text{IF}\beta^{**}\text{G}$  connected space.

**Definition 6.2.10 :** An IFTS  $(X, \tau)$  is called  $\text{IF}\beta^{**}\text{G}$  connected between two IFSs  $A$  and  $B$  if there is no  $\text{IF}\beta^{**}\text{GOS}$   $E$  in  $(X, \tau)$  such that  $A \subseteq E$  and  $E \underset{q}{c} B$ .

**Example 6.2.11:** Let  $X = \{a, b\}$  and  $\tau = \{0_{\sim}, G, 1_{\sim}\}$  be an IFT on  $X$ , where  $G = \langle x, (0.6_a, 0.7_b), (0.4_a, 0.3_b) \rangle$ . Then, the IFTS  $(X, \tau)$  is an  $\text{IF}\beta^{**}\text{G}$  connected between the two IFSs  $A = \langle x, (0.7_a, 0.6_b), (0.3_a, 0.4_b) \rangle$  and  $B = \langle x, (0.3_a, 0.4_b), (0.6_a, 0.6_b) \rangle$  as there exists no  $\text{IF}\beta^{**}\text{GOS}$   $E$  such that  $A \subseteq E$  and  $E \underset{q}{c} B$ .

**Proposition 6.2.12 :** If an IFTS  $(X, \tau)$  is  $\text{IF}\beta^{**}G$  connected between two IFSs  $A$  and  $B$ , then it is  $\text{IFC}_5$ -connected between two IFSs  $A$  and  $B$  but the converse may not be true in general.

**Proof :** Suppose  $(X, \tau)$  is not  $\text{IFC}_5$ -connected between  $A$  and  $B$ , then there exists an IFOS  $E$  in  $(X, \tau)$  such that  $A \subseteq E$  and  $E \not\subseteq B$ . Since every IFOS is an  $\text{IF}\beta^{**}GOS$ , there exists an  $\text{IF}\beta^{**}GOS$   $E$  in  $(X, \tau)$  such that  $A \subseteq E$  and  $E \not\subseteq B$ . This implies  $(X, \tau)$  is not  $\text{IF}\beta^{**}G$  connected between  $A$  and  $B$ , a contradiction to our hypothesis. Therefore  $(X, \tau)$  is  $\text{IFC}_5$ -connected between  $A$  and  $B$ .

**Example 6.2.13 :** Let  $X = \{a, b\}$  and  $\tau = \{0, G, 1\}$  be an IFT on  $X$ , where  $G = \langle x, (0.5_a, 0.4_b), (0.5_a, 0.6_b) \rangle$ . Then  $(X, \tau)$  is  $\text{IFC}_5$ -connected between the IFSs  $A = \langle x, (0.3_a, 0.2_b), (0.7_a, 0.8_b) \rangle$  and  $B = \langle x, (0.6_a, 0.6_b), (0.4_a, 0.4_b) \rangle$ . But  $(X, \tau)$  is not  $\text{IF}\beta^{**}G$  connected between  $A$  and  $B$ , since the IFS  $E = \langle x, (0.3_a, 0.2_b), (0.7_a, 0.8_b) \rangle$  is an  $\text{IF}\beta^{**}GOS$  in  $X$  such that  $A \subseteq E$  and  $E \subseteq B^c$ .

**Proposition 6.2.14 :** An IFTS  $(X, \tau)$  is  $\text{IF}\beta^{**}G$  connected between two IFSs  $A$  and  $B$  if and only if there is no  $\text{IF}\beta^{**}GOS$  and  $\text{IF}\beta^{**}GCS$   $E$  in  $(X, \tau)$  such that  $A \subseteq E \subseteq B^c$ .

**Proof : Necessity :** Let  $(X, \tau)$  be  $\text{IF}\beta^{**}G$  connected between two IFSs  $A$  and  $B$ . Suppose that there exists an  $\text{IF}\beta^{**}GOS$  and  $\text{IF}\beta^{**}GCS$   $E$  in  $(X, \tau)$  such that  $A \subseteq E \subseteq B^c$ , then  $E \not\subseteq B$  and  $A \subseteq E$ . This implies  $(X, \tau)$  is not  $\text{IF}\beta^{**}G$  connected between  $A$  and  $B$ , by Definition 6.2.10. A contradiction to our hypothesis. Therefore there is no  $\text{IF}\beta^{**}GOS$  and  $\text{IF}\beta^{**}GCS$   $E$  in  $(X, \tau)$  such that  $A \subseteq E \subseteq B^c$ .

**Sufficiency :** Suppose that  $(X, \tau)$  is not  $\text{IF}\beta^{**}G$  connected between  $A$  and  $B$ . Then there exists an  $\text{IF}\beta^{**}GOS$   $E$  in  $(X, \tau)$  such that  $A \subseteq E$  and  $E \not\subseteq B$ . This implies that there exists  $\text{IF}\beta^{**}GOS$   $E$  in  $(X, \tau)$  such that  $A \subseteq E \subseteq B^c$ . But this is a contradiction to our hypothesis. Hence  $(X, \tau)$  is  $\text{IF}\beta^{**}G$  connected between  $A$  and  $B$ .

**Proposition 6.2.15 :** If an IFTS  $(X, \tau)$  is  $\text{IF}\beta^{**}G$  connected between two IFSs  $A$  and  $B$ ,  $A \subseteq A_1$  and  $B \subseteq B_1$ , then  $(X, \tau)$  is  $\text{IF}\beta^{**}G$  connected between  $A_1$  and  $B_1$ .

**Proof :** Suppose that  $(X, \tau)$  is not  $\text{IF}\beta^{**}G$  connected between  $A_1$  and  $B_1$ , then by Definition 6.2.10, there exists an  $\text{IF}\beta^{**}GOS$   $E$  in  $(X, \tau)$  such that  $A_1 \subseteq E$  and  $E \not\subseteq_q B_1$ .

This implies  $E \subseteq B_1^c$  and  $A_1 \subseteq E$ . That is  $A \subseteq A_1 \subseteq E$ . Hence  $A \subseteq E$ . Since  $E \subseteq B_1^c$ ,  $B_1 \subseteq E^c$ . That is  $B \subseteq B_1 \subseteq E^c$ . Hence  $E \subseteq B^c$ . Therefore  $(X, \tau)$  is not  $\text{IF}\beta^{**}G$  connected between  $A$  and  $B$ , which is a contradiction to our hypothesis. Thus  $(X, \tau)$  is an  $\text{IF}\beta^{**}G$  connected between  $A_1$  and  $B_1$ .

**Proposition 6.2.16 :** Let  $(X, \tau)$  be an IFTS and  $A$  and  $B$  be IFSs in  $(X, \tau)$ . If  $A \subseteq_q B$ , then  $(X, \tau)$  is  $\text{IF}\beta^{**}G$  connected between  $A$  and  $B$ .

**Proof :** Suppose  $(X, \tau)$  is not  $\text{IF}\beta^{**}G$  connected between  $A$  and  $B$ . Then there exists an  $\text{IF}\beta^{**}GOS$   $E$  in  $(X, \tau)$  such that  $A \subseteq E$  and  $E \not\subseteq B^c$ . This implies that  $A \subseteq B^c$ . That is  $A \subseteq_q B$ . But this is a contradiction to our hypothesis. Therefore  $(X, \tau)$  is  $\text{IF}\beta^{**}G$  connected between  $A$  and  $B$ .

**Definition 6.2.17 :** An IFS  $A$  is called an **intuitionistic fuzzy regular  $\beta^{**}$  generalized open set** ( $\text{IFR}\beta^{**}GOS$ ) if  $A = \beta^{**}gint(\beta^{**}gcl(A))$ . The complement of an  $\text{IFR}\beta^{**}GOS$  is called an **intuitionistic fuzzy regular  $\beta^{**}$  generalized closed set** ( $\text{IFR}\beta^{**}GCS$ ) in  $(X, \tau)$ .

**Definition 6.2.18 :** An IFTS  $(X, \tau)$  is called an **intuitionistic fuzzy  $\beta^{**}$  generalized super** ( $\text{IF}\beta^{**}G$  super) **connected space** if there exists no proper intuitionistic fuzzy regular  $\beta^{**}$  generalized open set in  $(X, \tau)$ .

**Proposition 6.2.19 :** Let  $(X, \tau)$  be an IF $\beta^{**}G$ , then the following are equivalent :

- (a)  $(X, \tau)$  is an IF $\beta^{**}G$  super connected space,
- (b) For every non-zero IFR $\beta^{**}GOS$   $A$ ,  $\beta^{**}gcl(A) = 1_{\sim}$ ,
- (c) For every IFR $\beta^{**}GCS$   $A$  with  $A \neq 1_{\sim}$ ,  $\beta^{**}gint(A) = 0_{\sim}$ ,
- (d) There exists no IFR $\beta^{**}GOSs$   $A$  and  $B$  in  $(X, \tau)$  such that  $A \neq 0_{\sim} \neq B$ ,  $A \subseteq B^c$ ,
- (e) There exists no IFR $\beta^{**}GOSs$   $A$  and  $B$  in  $(X, \tau)$  such that  $A \neq 0_{\sim} \neq B$ ,  $B = (\beta^{**}gcl(A))^c$ ,  $A = (\beta^{**}gcl(B))^c$ ,
- (f) There exists no IFR $\beta^{**}GCSs$   $A$  and  $B$  in  $(X, \tau)$  such that  $A \neq 1_{\sim} \neq B$ ,  $B = (\beta^{**}gint(A))^c$ ,  $A = (\beta^{**}gint(B))^c$ .

**Proof :** (a)  $\Rightarrow$  (b) Assume that there exists an IFR $\beta^{**}GOS$   $A$  in  $(X, \tau)$  such that  $A \neq 0_{\sim}$  and  $\beta^{**}gcl(A) \neq 1_{\sim}$ . Now let  $B = \beta^{**}gint(\beta^{**}gcl(A))^c$ . Then  $B$  is a proper IFR $\beta^{**}GOS$  in  $(X, \tau)$ . But this is a contradiction to the fact that  $(X, \tau)$  is an IF $\beta^{**}G$  super connected space. Therefore  $\beta^{**}gcl(A) = 1_{\sim}$ .

(b)  $\Rightarrow$  (c) Let  $A \neq 1_{\sim}$  be an IFR $\beta^{**}GCS$  in  $(X, \tau)$ . If  $B = A^c$ , then  $B$  is an IFR $\beta^{**}GOS$  in  $(X, \tau)$  with  $B \neq 0_{\sim}$ . Hence  $\beta^{**}gcl(B) = 1_{\sim}$ , by hypothesis. This implies  $(\beta^{**}gcl(B))^c = 0_{\sim}$ . That is  $\beta^{**}gint(B^c) = 0_{\sim}$ . Hence  $\beta^{**}gint(A) = 0_{\sim}$ .

(c)  $\Rightarrow$  (d) Suppose  $A$  and  $B$  be two IFR $\beta^{**}GOSs$  in  $(X, \tau)$  such that  $A \neq 0_{\sim} \neq B$ ,  $A \subseteq B^c$ . Since  $B^c$  is an IFR $\beta^{**}GCS$  in  $(X, \tau)$  and  $B \neq 0_{\sim}$  implies  $B^c \neq 1_{\sim}$ ,  $B^c = \beta^{**}gcl(\beta^{**}gint(B^c))$  and we have  $\beta^{**}gint(B^c) = 0_{\sim}$ . But  $A \subseteq B^c$ . Therefore  $0_{\sim} \neq A = \beta^{**}gint(\beta^{**}gcl(A)) \subseteq \beta^{**}gint(\beta^{**}gcl(B^c)) = \beta^{**}gint(\beta^{**}gcl(\beta^{**}gcl(\beta^{**}gint(B^c)))) = \beta^{**}gint(\beta^{**}gcl(\beta^{**}gint(B^c))) = \beta^{**}gint(B^c) = 0_{\sim}$ . A contradiction arises. Therefore (d) is true.

(d)  $\Rightarrow$  (a) Suppose  $0_{\sim} \neq A \neq 1_{\sim}$  be an IFR $\beta^{**}GOS$  in  $(X, \tau)$ . If we take  $B = (\beta^{**}gcl(A))^c$ , then  $B$  is an IFR $\beta^{**}GOS$ , since  $\beta^{**}gint(\beta^{**}gcl(B)) = \beta^{**}gint(\beta^{**}gcl(\beta^{**}gcl(A))^c) = \beta^{**}gint(\beta^{**}gint(\beta^{**}gcl(A)))^c = \beta^{**}gint(A^c) = (\beta^{**}gcl(A))^c$

$= B$ . Also we get  $B \neq 0_\sim$ , since otherwise, if  $B = 0_\sim$ , this implies  $(\beta^{**} \text{gcl}(A))^c = 0_\sim$ . That is  $\beta^{**} \text{gcl}(A) = 1_\sim$ . Hence  $A = \beta^{**} \text{gint}(\beta^{**} \text{gcl}(A)) = \beta^{**} \text{gint}(1_\sim) = 1_\sim$ , which is a contradiction. Therefore  $B \neq 0_\sim$  and  $A \subseteq B^c$ . But this is a contradiction to (d). Therefore  $(X, \tau)$  is an  $\text{IF}\beta^{**}G$  super connected space.

(a)  $\Rightarrow$  (e) Suppose  $A$  and  $B$  are any two  $\text{IFR}\beta^{**}GOS$ s in  $(X, \tau)$  such that  $A \neq 0_\sim \neq B$ ,  $B = (\beta^{**} \text{gcl}(A))^c$  and  $A = (\beta^{**} \text{gcl}(B))^c$ . Now we have  $\beta^{**} \text{gint}(\beta^{**} \text{gcl}(A)) = \beta^{**} \text{gint}(B^c) = (\beta^{**} \text{gcl}(B))^c = A$ ,  $A \neq 0_\sim$  and  $A \neq 1_\sim$ , since if  $A = 1_\sim$ , then  $1_\sim = (\beta^{**} \text{gcl}(B))^c \Rightarrow (\beta^{**} \text{gcl}(B)) = 0_\sim \Rightarrow B = 0_\sim$ . But  $B \neq 0_\sim$ . Therefore  $A \neq 1_\sim \Rightarrow A$  is a proper  $\text{IFR}\beta^{**}GOS$  in  $(X, \tau)$ , which is a contradiction to (a). Hence (e) is true.

(e)  $\Rightarrow$  (a) Suppose  $A$  is an  $\text{IFR}\beta^{**}GOS$  in  $(X, \tau)$  such that  $0_\sim \neq A \neq 1_\sim$ . Now take  $B = (\beta^{**} \text{gcl}(A))^c$ . In this case we get  $B \neq 0_\sim$  and  $B$  is an  $\text{IFR}\beta^{**}GOS$  in  $(X, \tau)$ ,  $B = (\beta^{**} \text{gcl}(A))^c$  and  $(\beta^{**} \text{gcl}(B))^c = (\beta^{**} \text{gcl}(\beta^{**} \text{gcl}(A))^c)^c = \beta^{**} \text{gint}(\beta^{**} \text{gcl}(A))^c = \beta^{**} \text{gint}(\beta^{**} \text{gcl}(A)) = A$ . But this is a contradiction to (e). Therefore  $(X, \tau)$  is an  $\text{IF}\beta^{**}G$  super connected space.

(e)  $\Rightarrow$  (f) Suppose  $A$  and  $B$  be two  $\text{IFR}\beta^{**}GCS$ s in  $(X, \tau)$  such that  $A \neq 1_\sim \neq B$ ,  $B = (\beta^{**} \text{gint}(A))^c$  and  $A = (\beta^{**} \text{gint}(B))^c$ . Taking  $C = A^c$  and  $D = B^c$ ,  $C$  and  $D$  become  $\text{IFR}\beta^{**}GOS$ s in  $(X, \tau)$  with  $C \neq 0_\sim \neq D$ ,  $D = (\beta^{**} \text{gcl}(C))^c = (\beta^{**} \text{gcl}(D))^c$ , which is a contradiction to (e). Hence (f) is true.

(f)  $\Rightarrow$  (e) It can be proved easily by the similar way as in (e)  $\Rightarrow$  (f).
