**Abstract**

In this paper we introduce the new class of homeomorphisms called generalized beta homeomorphisms in intuitionistic fuzzy topological spaces. We also introduce M-generalized beta homeomorphisms in intuitionistic fuzzy topological spaces and investigate some of the properties. We provide the relation between intuitionistic fuzzy generalized beta homeomorphisms and intuitionistic fuzzy M-generalized beta homeomorphisms. Also we prove that the set of all M-generalized beta homeomorphisms forms a group under the operation of composition of maps.

**Keywords:** Intuitionistic fuzzy topology, intuitionistic fuzzy generalized beta  $T_{1/2}$  space, intuitionistic fuzzy generalized beta homeomorphisms and intuitionistic fuzzy M-generalized beta homeomorphisms.

**I. Introduction**

Zadeh [6] introduced fuzzy sets. After that Atanassov [1] introduced intuitionistic fuzzy sets. Using the notion of intuitionistic fuzzy sets, Coker [3] introduced the notion of intuitionistic fuzzy topological spaces. The notion of homeomorphisms plays a vital role in intuitionistic fuzzy topology as well as in topology. Here we introduce the new class of homeomorphisms called generalized beta homeomorphisms in intuitionistic fuzzy topological spaces. We also introduce the M-generalized beta homeomorphisms in intuitionistic fuzzy topological spaces and investigate some of the properties. We provide the relation between intuitionistic fuzzy generalized beta homeomorphisms and intuitionistic fuzzy M-generalized beta homeomorphisms. Also we prove that the set of all M-generalized beta homeomorphisms forms a group under the operation of composition of maps.

**II. Preliminaries**

**Definition 2.1:** [1] An *intuitionistic fuzzy set* (IFS in short)  $A$  in  $X$  is an object having the form

$$A = \{ \langle x, \mu_A(x), \nu_A(x) \rangle \mid x \in X \}$$

where the functions  $\mu_A: X \rightarrow [0,1]$  and  $\nu_A: X \rightarrow [0,1]$  denote the degree of membership (namely  $\mu_A(x)$ ) and the degree of non-membership (namely  $\nu_A(x)$ ) of each element  $x \in X$  to the set  $A$ , respectively, and  $0 \leq \mu_A(x) + \nu_A(x) \leq 1$  for each  $x \in X$ . Denote by  $\text{IFS}(X)$ , the set of all intuitionistic fuzzy sets in  $X$ .

**Definition 2.2:** [1] Let  $A$  and  $B$  be IFSs of the form  $A = \{ \langle x, \mu_A(x), \nu_A(x) \rangle \mid x \in X \}$  and  $B = \{ \langle x, \mu_B(x), \nu_B(x) \rangle \mid x \in X \}$ . Then

- a)  $A \subseteq B$  if and only if  $\mu_A(x) \leq \mu_B(x)$  and  $\nu_A(x) \geq \nu_B(x)$  for all  $x \in X$
- b)  $A = B$  if and only if  $A \subseteq B$  and  $B \subseteq A$
- c)  $A^c = \{ \langle x, \nu_A(x), \mu_A(x) \rangle \mid x \in X \}$
- d)  $A \cap B = \{ \langle x, \mu_A(x) \wedge \mu_B(x), \nu_A(x) \vee \nu_B(x) \rangle \mid x \in X \}$
- e)  $A \cup B = \{ \langle x, \mu_A(x) \vee \mu_B(x), \nu_A(x) \wedge \nu_B(x) \rangle \mid x \in X \}$

For the sake of simplicity, we shall use the notation  $A = \langle x, \mu_A, \nu_A \rangle$  instead of  $A = \{ \langle x, \mu_A(x), \nu_A(x) \rangle \mid x \in X \}$ . The intuitionistic fuzzy sets  $0_\sim = \{ \langle x, 0, 1 \rangle \mid x \in X \}$  and  $1_\sim = \{ \langle x, 1, 0 \rangle \mid x \in X \}$  are respectively the empty set and the whole set of  $X$ .

**Definition 2.3:** [2] An *intuitionistic fuzzy topology* (IFT for short) on  $X$  is a family  $\tau$  of IFSs in  $X$  satisfying the following axioms.

- (i)  $0_{\sim}, 1_{\sim} \in \tau$
- (ii)  $G_1 \cap G_2 \in \tau$  for any  $G_1, G_2 \in \tau$
- (iii)  $\cup G_i \in \tau$  for any family  $\{G_i / i \in J\} \subseteq \tau$ .

In this case the pair  $(X, \tau)$  is called an *intuitionistic fuzzy topological space* (IFTS in short) and any IFS in  $\tau$  is known as an intuitionistic fuzzy open set (IFOS in short) in  $X$ . The complement  $A^c$  of an IFOS  $A$  in IFTS  $(X, \tau)$  is called an intuitionistic fuzzy closed set (IFCS in short) in  $X$ .

**Definition 2.4:**[2] Let  $(X, \tau)$  be an IFTS and  $A = \langle x, \mu_A, \nu_A \rangle$  be an IFS in  $X$ . Then the intuitionistic fuzzy interior and intuitionistic fuzzy closure are defined by

$$\text{int}(A) = \cup \{G / G \text{ is an IFOS in } X \text{ and } G \subseteq A\} \quad \text{cl}(A) = \cap \{K / K \text{ is an IFCS in } X \text{ and } A \subseteq K\}$$

**Definition 2.5:**[2] An IFS  $A = \langle x, \mu_A, \nu_A \rangle$  in an IFTS  $(X, \tau)$  is said to be an

- (i) *intuitionistic fuzzy beta closed set* (IF $\beta$ CS for short) if  $\text{int}(\text{cl}(\text{int}(A))) \subseteq A$ .
- intuitionistic fuzzy beta open set* (IF $\beta$ OS for short) if  $A \subseteq \text{cl}(\text{int}(\text{cl}(A)))$ .

**Definition 2.6:**[3] Let  $A$  be an IFS in an IFTS  $(X, \tau)$ . Then the beta interior and the beta closure of  $A$  are defined by

$$\beta\text{int}(A) = \cup \{G / G \text{ is an IF}\beta\text{OS in } X \text{ and } G \subseteq A\}. \quad \beta\text{cl}(A) = \cap \{K / K \text{ is an IF}\beta\text{CS in } X \text{ and } A \subseteq K\}.$$

We have for any IFS  $A$  in  $(X, \tau)$ ,  $\beta\text{cl}(A^c) = (\beta\text{int}(A))^c$  and  $\beta\text{int}(A^c) = (\beta\text{cl}(A))^c$  [3].

**Definition 2.7:**[3] An IFS  $A$  in an IFTS  $(X, \tau)$  is said to be an *intuitionistic fuzzy generalized beta closed set* (IFG $\beta$ CS for short) if  $\beta\text{cl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is an IFOS in  $(X, \tau)$ .

Every IF $\beta$ CS is an IFG $\beta$ CS but the converse may not be true in general [3].

**Definition 2.8:**[3] The complement  $A^c$  of *intuitionistic fuzzy generalized beta open set* an IFG $\beta$ CS  $A$  in an IFTS  $(X, \tau)$  is called an (IFG $\beta$ OS for short) in  $X$

**Definition 2.9:**[3] If every IFG $\beta$ CS in  $(X, \tau)$  is an IF $\beta$ CS in  $(X, \tau)$ , then the space can be called as an *intuitionistic fuzzy  $\beta T_{1/2}$  space* (IF $\beta T_{1/2}$  space for short).

**Definition 2.10:**[4] A mapping  $f: (X, \tau) \rightarrow (Y, \sigma)$  is called an *intuitionistic fuzzy generalized beta continuous mapping* (IFG $\beta$  continuous mapping for short) if  $f^{-1}(V)$  is an IFG $\beta$ CS in  $(X, \tau)$  for every IFCS  $V$  of  $(Y, \sigma)$ .

**Definition 2.11:**[4] A mapping  $f: (X, \tau) \rightarrow (Y, \sigma)$  is called *intuitionistic fuzzy generalized beta irresolute* (IFG $\beta$  irresolute) mapping if  $f^{-1}(V)$  is an IFG $\beta$ CS in  $(X, \tau)$  for every IFG $\beta$ CS  $V$  of  $(Y, \sigma)$ .

**Definition 2.12:**[5] A map  $f: X \rightarrow Y$  is called an *intuitionistic fuzzy generalized beta closed mapping* (IFG $\beta$ CM for short) if  $f(A)$  is an IFG $\beta$ CS in  $Y$  for each IFCS  $A$  in  $X$ .

**Definition 2.13:**[5] A mapping  $f: X \rightarrow Y$  is said to be an *intuitionistic fuzzy generalized beta open mapping* (IFG $\beta$ OM for short) if  $f(A)$  is an IFG $\beta$ OS in  $Y$  for each IFOS in  $X$ .

**Definition 2.14:**[5] A mapping  $f: X \rightarrow Y$  is said to be an *intuitionistic fuzzy  $M$ -generalized beta closed mapping* (IFMG $\beta$ CM, for short) if  $f(A)$  is an IFG $\beta$ CS in  $Y$  for every IFG $\beta$ CS  $A$  in  $X$ .

### III. Generalized Beta Homeomorphisms in Intuitionistic Fuzzy Topological Spaces

In this section we introduce intuitionistic fuzzy generalized beta homeomorphisms and investigate some properties.

**Definition 3.1:** Let  $f: X \rightarrow Y$  be a bijective mapping. Then  $f$  is said to be an intuitionistic fuzzy generalized beta homeomorphism (IFG $\beta$ HM for short) if  $f$  is both an IFG $\beta$  continuous mapping and an IFG $\beta$ OM.

**Example 3.2:** Let  $X = \{a, b\}$ ,  $Y = \{u, v\}$  and  $G_1 = \cdot x, (0.5_a, 0.6_b), (0.5_a, 0.4_b) \cdot$ ,  $G_2 = \cdot y, (0.2_u, 0.3_v), (0.8_u, 0.7_v) \cdot$ . Then  $\tau = \{0_\cdot, G_1, 1_\cdot\}$  and  $\sigma = \{0_\cdot, G_2, 1_\cdot\}$  are IFTs on  $X$  and  $Y$  respectively. Define a mapping  $f: (X, \tau) \rightarrow (Y, \sigma)$  by  $f(a) = u$  and  $f(b) = v$ . Then  $f$  is an IFG $\beta$ HM.

**Theorem 3.3:** Let  $f: X \rightarrow Y$  be a bijective mapping. If  $f$  is an IFG $\beta$  continuous mapping, then the following are equivalent:  
(i)  $f$  is an IFG $\beta$ OM (ii)  $f$  is an IFG $\beta$ HM (iii)  $f$  is an IFG $\beta$ CM.

**Proof:** Straightforward.

**Remark 3.4:** The composition of two IFG $\beta$ HMs need not be an IFG $\beta$ HM in general.

**Example 3.5:** Let  $X = \{a, b\}$ ,  $Y = \{c, d\}$  and  $Z = \{e, f\}$ . Let  $G_1 = \cdot x, (0.5_a, 0.6_b), (0.5_a, 0.4_b) \cdot$ ,  $G_2 = \cdot x, (0.8_a, 0.7_b), (0.2_a, 0.3_b) \cdot$ ,  $G_3 = \cdot y, (0.8_c, 0.9_d), (0.2_c, 0.1_d) \cdot$ ,  $G_4 = \cdot z, (0.4_e, 0.3_f), (0.6_e, 0.7_f) \cdot$  and  $G_5 = \cdot z, (0.2_e, 0.2_f), (0.8_e, 0.8_f) \cdot$  and  $\tau = \{0_\cdot, G_1, G_2, 1_\cdot\}$ ,  $\sigma = \{0_\cdot, G_3, 1_\cdot\}$  and  $\eta = \{0_\cdot, G_4, G_5, 1\}$  are IFTs on  $X$ ,  $Y$  and  $Z$  respectively. Define a mapping  $f: (X, \tau) \rightarrow (Y, \sigma)$  by  $f(a) = c$  and  $f(b) = d$  and  $g: (Y, \sigma) \rightarrow (Z, \eta)$  by  $g(c) = e$  and  $g(d) = f$ . Then  $f$  and  $g$  are IFG $\beta$ HMs but  $g \circ f: X \rightarrow Z$  is not an IFG $\beta$ HM, since  $g \circ f$  is not an IFG $\beta$  continuous mapping, since  $G_4^c = \cdot z, (0.6_e, 0.7_f), (0.4_e, 0.3_f) \cdot$  is an IFCS in  $Z$  but  $(g \circ f)^{-1}(G_4^c) = \cdot x, (0.6_a, 0.7_b), (0.4_a, 0.3_b) \cdot$  is not an IFG $\beta$ CS in  $X$ , since  $(g \circ f)^{-1}(G_4^c) = \cdot x, (0.6_a, 0.7_b), (0.4_a, 0.3_b) \cdot \subseteq G_2$  but  $\beta cl((g \circ f)^{-1}(G_4^c)) = 1_\cdot \not\subseteq G_2$ .

**Definition 3.6:** Let  $f: X \rightarrow Y$  be a bijective mapping. Then  $f$  is said to be an intuitionistic fuzzy  $M$  generalized beta homeomorphism (IFMG $\beta$ HM for short) if  $f$  is both an IFG $\beta$  irresolute mapping and an IFMG $\beta$ OM.

The family of all IFMG $\beta$ HMs in  $X$  is denoted by IFMG $\beta$ HM( $X$ ).

**Theorem 3.7:** Every IFMG $\beta$ HM is an IFG $\beta$ HM but not conversely.

**Proof:** Let  $f: X \rightarrow Y$  be an IFMG $\beta$ HM. Let  $A \subseteq Y$  be an IFCS. Then  $A$  is an IFG $\beta$ CS in  $Y$ . By hypothesis,  $f^{-1}(A)$  is an IFG $\beta$ CS in  $X$ . Hence  $f$  is an IFG $\beta$  continuous mapping. Let  $B \subseteq X$  be an IFOS. Then  $B$  is an IFG $\beta$ OS in  $X$ . By hypothesis,  $f(B)$  is an IFG $\beta$ OS in  $Y$ . Hence  $f$  is an IFG $\beta$ OM. Thus  $f$  is an IFG $\beta$ HM.

**Example 3.8:** Let  $X = \{a, b\}$ ,  $Y = \{u, v\}$  and  $G_1 = \cdot x, (0.4_a, 0.6_b), (0.6_a, 0.4_b) \cdot$ ,  $G_2 = \cdot x, (0.5_a, 0.7_b), (0.5_a, 0.3_b) \cdot$ ,  $G_3 = \cdot y, (0.2_u, 0.3_v), (0.8_u, 0.7_v) \cdot$ , then  $\tau = \{0_\cdot, G_1, G_2, 1_\cdot\}$  and  $\sigma = \{0_\cdot, G_3, 1_\cdot\}$  are IFTs on  $X$  and  $Y$  respectively. Define a mapping  $f: (X, \tau) \rightarrow (Y, \sigma)$  by  $f(a) = u$  and  $f(b) = v$ . Then  $f$  is an IFG $\beta$ HM but not an IFMG $\beta$ HM, since  $A = \cdot y, (0.4_u, 0.7_v), (0.6_u, 0.3_v) \cdot$  is an IFG $\beta$ CS in  $Y$  but  $f^{-1}(A)$  is not an IFG $\beta$ CS in  $X$ , since  $f^{-1}(A) = \cdot x, (0.4_a, 0.7_b), (0.6_a, 0.3_b) \cdot \subseteq G_2$  but  $\beta cl(f^{-1}(A)) = 1_\cdot \not\subseteq G_2$ .

**Theorem 3.9:** The composition of two IFMG $\beta$ HMs is an IFMG $\beta$ HM.

**Proof:** Let  $f: X \rightarrow Y$  and  $g: Y \rightarrow Z$  be any two IFMG $\beta$ HMs. Let  $A \subseteq Z$  be an IFG $\beta$ CS. Then by hypothesis,  $g^{-1}(A)$  is an IFG $\beta$ CS in  $Y$ . Again by hypothesis,  $f^{-1}(g^{-1}(A))$  is an IFG $\beta$ CS in  $X$ . Therefore  $g \circ f$  is an IFG $\beta$  irresolute mapping. Now let  $B \subseteq X$  be an IFG $\beta$ OS. Then by hypothesis,  $f(B)$  is an IFG $\beta$ OS in  $Y$  and also  $g(f(B))$  is an IFG $\beta$ OS in  $Z$ . This implies  $g \circ f$  is an IFMG $\beta$ OM. Hence  $g \circ f$  is an IFMG $\beta$ HM.

**Theorem 3.10:** Let  $f: X \rightarrow Y$  be a bijective mapping. If  $f$  is an IFG $\beta$  irresolute mapping, then the following are equivalent:

(i)  $f$  is an IFMG $\beta$ OM (ii)  $f$  is an IFMG $\beta$ HM (iii)  $f$  is an IFMG $\beta$ CM.

**Proof:** Straightforward.

**Theorem 3.11:** The set of all IFMG $\beta$ HMs in an IFTS  $(X, \tau)$  is a group under the composition of maps.

**Proof:** Define a binary operation  $*$  : IFMG $\beta$ HM( $X$ )  $\times$  IFMG $\beta$ HM( $X$ )  $\rightarrow$  IFMG $\beta$ HM( $X$ ) by  $f * g = g \circ f$  for every  $f, g \in$

IFMG $\beta$ HM(X) and  $\circ$  is the usual operation of composition of maps. Since  $g \in \text{IFMG}\beta\text{HM}(X)$  and  $f \in \text{IFMG}\beta\text{HM}(X)$ , by Theorem 3.9,  $g \circ f \in \text{IFMG}\beta\text{HM}(X)$ . We know that the composition of maps is associative. The identity map  $I: (X, \tau) \rightarrow (X, \tau)$  belonging to  $\text{IFMG}\beta\text{HM}(X)$  is the identity element. If  $f \in \text{IFMG}\beta\text{HM}(X)$ , then  $f^{-1} \in \text{IFMG}\beta\text{HM}(X)$ . Therefore  $f \circ f^{-1} = f^{-1} \circ f = I$  and so the inverse exists for each element of  $\text{IFMG}\beta\text{HM}(X)$ . Hence  $(\text{IFMG}\beta\text{HM}(X), \circ)$  is a group under the composition of maps.

**Theorem 3.12:** If  $f: X \rightarrow Y$  is an IFMG $\beta$ HM, then  $g\beta\text{cl}(f^{-1}(B)) \subseteq f^{-1}(\beta\text{cl}(B))$  for every IFS  $B$  in  $Y$ .

**Proof:** Let  $B \subseteq Y$ . Then  $\beta\text{cl}(B)$  is an IFG $\beta$ CS in  $Y$ . Since  $f$  is an IFG $\beta$  irresolute mapping,  $f^{-1}(\beta\text{cl}(B))$  is an IFG $\beta$ CS in  $X$ . This implies  $g\beta\text{cl}(f^{-1}(\beta\text{cl}(B))) = f^{-1}(\beta\text{cl}(B))$ . Now  $g\beta\text{cl}(f^{-1}(B)) \subseteq g\beta\text{cl}(f^{-1}(\beta\text{cl}(B))) = f^{-1}(\beta\text{cl}(B))$ .

**Theorem 3.13:** If  $f: X \rightarrow Y$  is an IFMG $\beta$ HM, where  $X$  and  $Y$  are IF $\beta T_{1/2}$  spaces, then  $\beta\text{cl}(f^{-1}(B)) = f^{-1}(\beta\text{cl}(B))$  for every IFS  $B$  in  $Y$ .

**Proof:** Since  $f$  is an IFMG $\beta$ HM,  $f$  is an IFG $\beta$  irresolute mapping. Since  $\beta\text{cl}(f(B))$  is an IFG $\beta$ CS in  $Y$ ,  $f^{-1}(\beta\text{cl}(f(B)))$  is an IFG $\beta$ CS in  $X$ . Since  $X$  is an IF $\beta T_{1/2}$  space,  $f^{-1}(\beta\text{cl}(f(B)))$  is an IF $\beta$ CS in  $X$ . Now,  $f^{-1}(B) \subseteq f^{-1}(\beta\text{cl}(B)) \subseteq \beta\text{cl}(f^{-1}(\beta\text{cl}(B)))$ . We have  $\beta\text{cl}(f^{-1}(B)) \subseteq \beta\text{cl}(f^{-1}(\beta\text{cl}(B))) = f^{-1}(\beta\text{cl}(B))$ . This implies  $\beta\text{cl}(f^{-1}(B)) \subseteq f^{-1}(\beta\text{cl}(B))$  ---- (\*). Again since  $f$  is an IFMG $\beta$ HM,  $f^{-1}$  is IFG $\beta$  irresolute mapping. Since  $\beta\text{cl}(f^{-1}(B))$  is an IFG $\beta$ CS in  $X$ ,  $(f^{-1})^{-1}(\beta\text{cl}(f^{-1}(B))) = f(\beta\text{cl}(f^{-1}(B)))$ , is an IFG $\beta$ CS in  $Y$ . Now  $B \subseteq (f^{-1})^{-1}(\beta\text{cl}(f^{-1}(B))) \subseteq (f^{-1})^{-1}(\beta\text{cl}(f^{-1}(B))) = f(\beta\text{cl}(f^{-1}(B)))$ . Therefore  $\beta\text{cl}(B) \subseteq \beta\text{cl}(f(\beta\text{cl}(f^{-1}(B)))) = f(\beta\text{cl}(f^{-1}(B)))$ , since  $Y$  is an IF $\beta T_{1/2}$  space. Hence  $f^{-1}(\beta\text{cl}(B)) \subseteq f^{-1}(f(\beta\text{cl}(f^{-1}(B)))) \subseteq \beta\text{cl}(f^{-1}(B))$ . That is  $f^{-1}(\beta\text{cl}(B)) \subseteq \beta\text{cl}(f^{-1}(B))$  ---- (\*\*). Thus from (\*) and (\*\*) we get  $\beta\text{cl}(f^{-1}(B)) = f^{-1}(\beta\text{cl}(B))$  and hence the proof.

**Corollary 3.14:** If  $f: X \rightarrow Y$  is an IFMG $\beta$ HM, where  $X$  and  $Y$  are IF $\beta T_{1/2}$  spaces, then  $\beta\text{cl}(f(B)) = f(\beta\text{cl}(B))$  for every IFS  $B$  in  $X$ .

**Proof:** Since  $f$  is an IFMG $\beta$ HM,  $f^{-1}$  is also an IFMG $\beta$ HM. Therefore by Theorem 3.13  $\beta\text{cl}((f^{-1})^{-1}(B)) = (f^{-1})^{-1}(\beta\text{cl}(B))$  for every  $B \subseteq X$ . That is  $\beta\text{cl}(f(B)) = f(\beta\text{cl}(B))$  for every IFS  $B$  in  $X$ .

**Corollary 3.15:** If  $f: X \rightarrow Y$  is an IFMG $\beta$ HM, where  $X$  and  $Y$  are IF $\beta T_{1/2}$  spaces, then  $\beta\text{int}(f(B)) = f(\beta\text{int}(B))$  for every IFS  $B$  in  $X$ .

**Proof:** For any IFS  $B \subseteq X$ ,  $\beta\text{int}(B) = (\beta\text{cl}(B^c))^c$ . By Corollary 3.14,  $f(\beta\text{int}(B)) = f(\beta\text{cl}(B^c))^c = (f(\beta\text{cl}(B^c)))^c = (\beta\text{cl}(f(B^c)))^c = \beta\text{int}(f(B^c))^c = \beta\text{int}(f(B^c)^c) = \beta\text{int}(f(B))$ .

**Corollary 3.16:** If  $f: X \rightarrow Y$  is an IFMG $\beta$ HM, where  $X$  and  $Y$  are IF $\beta T_{1/2}$  spaces, then  $\beta\text{int}(f^{-1}(B)) = f^{-1}(\beta\text{int}(B))$  for every IFS  $B$  in  $Y$ .

**Proof:** Since  $f$  is an IFMG $\beta$ HM,  $f^{-1}$  is also an IFMG $\beta$ HM, the proof directly follows from Corollary 3.15.
