

**6.1 Introduction**

Kelly (1963) initiated the study of bitopological spaces and thereafter various topological concepts have been generalized to bitopological spaces. Fukutake (1985) introduced  $g$ -closed sets in bitopological spaces. Jelic (1990) introduced  $\alpha$ -closed sets in bitopological spaces. Ramya and Parvathi (2013) introduced  $\psi g$ -closed sets in bitopological spaces

In this chapter, a new class of sets called  $(i, j)$ - $\psi^*$ - $\alpha$ -closed sets is introduced and their properties and characterizations are analyzed in bitopological spaces. A comparative study is carried out with already existing generalized notions of  $(i, j)$ -closed sets and  $(i, j)$ - $\psi^*$ - $\alpha$ -closed sets. As an application of  $(i, j)$ - $\psi^*$ - $\alpha$ -closed sets, four new spaces namely,  $(i, j)$ - $\psi^*$ - $T_c$ -space,  $(i, j)$ - $\psi^*$ - $T_\alpha$ -space,  $(i, j)$ - $g\alpha T_{\psi^*\alpha}$ -space and  $(i, j)$ - $\alpha g T_{\psi^*\alpha}$ -space are introduced and their interrelations are discussed.

**6.2 (i, j)- $\psi^*$ - $\alpha$ -closed sets**

In this section, the concept of  $(i, j)$ - $\psi^*$ - $\alpha$ -closed sets is defined and some of their characterizations and properties are studied.

**Definition 6.2.1** A subset  $A$  of a bitopological space  $(X, \tau_1, \tau_2)$  is called  **$(i, j)$ - $\psi^*$ - $\alpha$ -closed** if  $\tau_j\text{-acl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is  $\tau_i$ - $\psi g$ -open in  $(X, \tau_i)$ , where  $i, j = 1, 2$  and  $i \neq j$ .

The family of all  $(i, j)$ - $\psi^*$ - $\alpha$ -closed sets in  $(X, \tau_1, \tau_2)$  is denoted by  $\psi^*\alpha C(i, j)$ .

**Remark 6.2.2** By setting  $\tau_1 = \tau_2$  in definition 6.2.1, an  $(i, j)$ - $\psi^*$ - $\alpha$ -closed set is a  $\psi^*$ - $\alpha$ -closed set.

**Example 6.2.3** Let  $X = \{a, b, c\}$ ,  $\tau_1 = \{\phi, \{a\}, X\}$  and  $\tau_2 = \{\phi, \{a\}, \{b\}, \{a, b\}, X\}$ . Then  $\phi, \{c\}, \{a, c\}, \{b, c\}, X$  are  $(1, 2)$ - $\psi^*$ - $\alpha$ -closed.

**Proposition 6.2.4** Every  $\tau_j$ -closed (resp.  $\tau_j$ - $\alpha$ -closed,  $\tau_j$ -regular closed) set is  $(i, j)$ - $\psi^*$ - $\alpha$ -closed in  $(X, \tau_1, \tau_2)$

**Proof:** Let  $A$  be a  $\tau_j$ -closed set (resp.  $\tau_j$ - $\alpha$ -closed,  $\tau_j$ -regular closed) and  $U$  be any  $\psi$ g-open set in  $X$  containing  $A$ . Since  $A$  is  $\tau_j$ -closed (resp.  $\tau_j$ - $\alpha$ -closed,  $\tau_j$ -regular closed),  $\tau_j$ - $\text{cl}(A)$  (resp.  $\tau_j$ - $\alpha\text{cl}(A)$ ,  $\tau_j$ - $\text{rcl}(A)$ ) =  $A \subseteq U$ . But  $\tau_j$ - $\alpha\text{cl}(A) \subseteq \tau_j$ - $\text{cl}(A)$  (resp.  $\tau_j$ - $\alpha\text{cl}(A)$ ,  $\tau_j$ - $\text{rcl}(A)$ ). Therefore  $\tau_j$ - $\alpha\text{cl}(A) \subseteq U$ . Hence  $A$  is an  $(i, j)$ - $\psi^*$ - $\alpha$ -closed set in  $(X, \tau_1, \tau_2)$ .

The converse of the above proposition is not true in general as seen from the following examples.

**Example 6.2.5** Let  $X = \{a, b, c\}$ ,  $\tau_1 = \{\emptyset, \{a\}, X\}$  and  $\tau_2 = \{\emptyset, \{a\}, \{a, b\}, X\}$ . Then the subset  $\{b\}$  is  $(1, 2)$ - $\psi^*$ - $\alpha$ -closed but not  $\tau_2$ -closed.

**Example 6.2.6** Let  $X = \{a, b, c\}$ ,  $\tau_1 = \{\emptyset, \{a\}, X\}$  and  $\tau_2 = \{\emptyset, \{a, b\}, X\}$ . Then the subset  $\{b, c\}$  is  $(1, 2)$ - $\psi^*$ - $\alpha$ -closed but not  $\tau_2$ - $\alpha$ -closed.

**Example 6.2.7** Let  $X = \{a, b, c\}$ ,  $\tau_1 = \{\emptyset, \{a\}, \{a, b\}, X\}$  and  $\tau_2 = \{\emptyset, \{a\}, \{a, b\}, \{a, c\}, X\}$ . Then the subset  $\{c\}$  is  $(1, 2)$ - $\psi^*$ - $\alpha$ -closed but not  $\tau_2$ -regular closed

**Proposition 6.2.8** Every  $(i, j)$ - $\psi^*$ - $\alpha$ -closed set in  $(X, \tau_1, \tau_2)$  is  $(i, j)$ -gp-closed but not conversely.

**Proof:** Let  $A$  be an  $(i, j)$ - $\psi^*$ - $\alpha$ -closed set in  $(X, \tau_1, \tau_2)$  and  $U$  be any  $\tau_1$ -open set in  $X$  containing  $A$ . Since every  $\tau_1$ -open set is  $\tau_1$ - $\psi$ g-open and  $A$  is  $(i, j)$ - $\psi^*$ - $\alpha$ -closed in  $(X, \tau_1, \tau_2)$ ,  $\tau_j$ - $\alpha\text{cl}(A) \subseteq U$ . We know that  $\tau_j$ - $\text{pcl}(A) \subseteq \tau_j$ - $\alpha\text{cl}(A) \subseteq U$ . Therefore  $A$  is  $(i, j)$ -gp-closed.

**Example 6.2.9** Let  $X = \{a, b, c, d\}$ ,  $\tau_1 = \{\emptyset, \{a\}, X\}$  and  $\tau_2 = \{\emptyset, \{d\}, \{a, b\}, \{a, b, d\}, X\}$ . Then the subset  $\{a, c, d\}$  is  $(1, 2)$ -gp-closed but not  $(1, 2)$ - $\psi^*$ - $\alpha$ -closed.

**Proposition 6.2.10** Every  $(i, j)$ - $\psi^*$ - $\alpha$ -closed set in  $(X, \tau_1, \tau_2)$  is  $(i, j)$ -gpr-closed but not conversely.

**Proof:** Let  $A$  be an  $(i, j)$ - $\psi^*$ - $\alpha$ -closed set in  $(X, \tau_1, \tau_2)$  and  $U$  be any  $\tau_1$ -regular open set in  $X$  containing  $A$ . Since every  $\tau_1$ -regular open set is  $\tau_1$ - $\psi$ g-open and  $A$  is  $(i, j)$ - $\psi^*$ - $\alpha$ -closed in  $(X, \tau_1, \tau_2)$ ,  $\tau_j$ - $\alpha$ cl( $A$ )  $\subseteq U$ . We know that  $\tau_j$ -pcl( $A$ )  $\subseteq \tau_j$ - $\alpha$ cl( $A$ )  $\subseteq U$ . Therefore  $A$  is  $(i, j)$ -gpr-closed.

**Example 6.2.11** Let  $X = \{a, b, c, d\}$ ,  $\tau_1 = \{\emptyset, \{a, b\}, X\}$  and  $\tau_2 = \{\emptyset, \{a\}, \{b\}, \{a, b\}, \{a, b, c\}, \{a, b, d\}, X\}$ . Then the subset  $\{a, d\}$  is  $(1, 2)$ -gpr-closed but not  $(1, 2)$ - $\psi^*$ - $\alpha$ -closed.

**Proposition 6.2.12** Every  $(i, j)$ - $\psi^*$ - $\alpha$ -closed set in  $(X, \tau_1, \tau_2)$  is  $(i, j)$ - $\tilde{g}_\alpha$ -closed but not conversely.

**Proof:** Let  $A$  be an  $(i, j)$ - $\psi^*$ - $\alpha$ -closed set in  $(X, \tau_1, \tau_2)$  and  $U$  be any  $\tau_1$ - $\#$ gs-open set in  $X$  containing  $A$ . Since every  $\tau_1$ - $\#$ gs-open set is  $\tau_1$ - $\psi$ g-open and  $A$  is  $(i, j)$ - $\psi^*$ - $\alpha$ -closed in  $(X, \tau_1, \tau_2)$ ,  $\tau_j$ - $\alpha$ cl( $A$ )  $\subseteq U$ . Therefore  $A$  is  $(i, j)$ - $\tilde{g}_\alpha$ -closed.

**Example 6.2.13** Let  $X = \{a, b, c, d\}$ ,  $\tau_1 = \{\emptyset, \{a\}, \{a, b\}, X\}$  and  $\tau_2 = \{\emptyset, \{d\}, \{a, b\}, \{a, b, d\}, X\}$ . Then the subset  $\{b, c\}$  is  $(1, 2)$ - $\tilde{g}_\alpha$ -closed but not  $(1, 2)$ - $\psi^*$ - $\alpha$ -closed.

**Proposition 6.2.14** Every  $(i, j)$ - $\psi^*$ - $\alpha$ -closed set in  $(X, \tau_1, \tau_2)$  is  $(i, j)$ -g $\alpha$ -closed but not conversely.

**Proof:** Let  $A$  be an  $(i, j)$ - $\psi^*$ - $\alpha$ -closed set in  $(X, \tau_1, \tau_2)$  and  $U$  be any  $\tau_1$ - $\alpha$ -open set in  $X$  containing  $A$ . Since every  $\tau_1$ - $\alpha$ -open set is  $\tau_1$ - $\psi$ g-open and  $A$  is  $(i, j)$ - $\psi^*$ - $\alpha$ -closed in  $(X, \tau_1, \tau_2)$ ,  $\tau_j$ - $\alpha$ cl( $A$ )  $\subseteq U$ . Therefore  $A$  is  $(i, j)$ -g $\alpha$ -closed.

**Example 6.2.15** Let  $X = \{a, b, c\}$ ,  $\tau_1 = \{\emptyset, \{a\}, \{b, c\}, X\}$  and  $\tau_2 = \{\emptyset, \{a\}, \{a, b\}, \{a, c\}, X\}$ . Then the subsets  $\{a, b\}$  and  $\{a, c\}$  are  $(1, 2)$ -g $\alpha$ -closed but not  $(1, 2)$ - $\psi^*$ - $\alpha$ -closed.

**Proposition 6.2.16** Every  $(i, j)$ - $\psi^*$ - $\alpha$ -closed set in  $(X, \tau_1, \tau_2)$  is  $(i, j)$ -ag-closed but not conversely.

**Proof:** Let  $A$  be an  $(i, j)$ - $\psi^*$ - $\alpha$ -closed set in  $(X, \tau_1, \tau_2)$  and  $U$  be any  $\tau_1$ -open set in  $X$  containing  $A$ . Since every  $\tau_1$ -open set is  $\tau_1$ - $\psi$ g-open and  $A$  is  $(i, j)$ - $\psi^*$ - $\alpha$ -closed in  $(X, \tau_1, \tau_2)$ ,  $\tau_j$ - $\alpha$ cl( $A$ )  $\subseteq U$ . Therefore  $A$  is  $(i, j)$ -ag-closed.

**Example 6.2.17** Let  $X = \{a, b, c\}$ ,  $\tau_1 = \{\phi, \{a\}, \{b, c\}, X\}$  and  $\tau_2 = \{\phi, \{a\}, X\}$ . Then the subsets  $\{a, b\}$  and  $\{a, c\}$  are  $(1, 2)$ - $\alpha$ g-closed but not  $(1, 2)$ - $\psi^*$  $\alpha$ -closed.

**Proposition 6.2.18** Every  $(i, j)$ - $\psi^*$  $\alpha$ -closed set in  $(X, \tau_1, \tau_2)$  is  $(i, j)$ - $\psi$ g-closed but not conversely.

**Proof:** Let  $A$  be an  $(i, j)$ - $\psi^*$  $\alpha$ -closed set in  $(X, \tau_1, \tau_2)$  and  $U$  be any  $\tau_i$ -open set in  $X$  containing  $A$ . Since every  $\tau_i$ -open set is  $\tau_i$ - $\psi$ g-open and  $A$  is  $(i, j)$ - $\psi^*$  $\alpha$ -closed in  $(X, \tau_1, \tau_2)$ ,  $\tau_j$ - $\alpha$ cl( $A$ )  $\subseteq U$ . We know that  $\tau_j$ - $\psi$ cl( $A$ )  $\subseteq \tau_j$ - $\alpha$ cl( $A$ )  $\subseteq U$  and so  $\tau_j$ - $\psi$ cl( $A$ )  $\subseteq U$ . Therefore  $A$  is  $(i, j)$ - $\psi$ g-closed.

**Example 6.2.19** Let  $X = \{a, b, c\}$ ,  $\tau_1 = \{\phi, \{a\}, X\}$  and  $\tau_2 = \{\phi, \{a, b\}, X\}$ . Then the subsets  $\{b\}$ ,  $\{c\}$ ,  $\{a, b\}$  and  $\{a, c\}$  are  $(1, 2)$ - $\psi$ g-closed but not  $(1, 2)$ - $\psi^*$  $\alpha$ -closed.

**Remark 6.2.20** The following examples show that  $(i, j)$ - $\alpha$ -closed set and  $(i, j)$ - $\psi^*$  $\alpha$ -closed set are independent.

**Example 6.2.21** Let  $X = \{a, b, c\}$ ,  $\tau_1 = \{\phi, \{a\}, \{b\}, \{a, b\}, X\}$  and  $\tau_2 = \{\phi, \{a\}, X\}$ . Then the subset  $\{a, c\}$  is  $(1, 2)$ - $\alpha$ -closed but not  $(1, 2)$ - $\psi^*$  $\alpha$ -closed.

**Example 6.2.22** Let  $X = \{a, b, c\}$ ,  $\tau_1 = \{\phi, \{a, b\}, X\}$  and  $\tau_2 = \{\phi, \{a\}, X\}$ . Then the subsets  $\{b\}$ ,  $\{b, c\}$  and  $\{a, c\}$  are  $(1, 2)$ - $\psi^*$  $\alpha$ -closed but not  $(1, 2)$ - $\alpha$ -closed.

**Remark 6.2.23** The following examples show that  $(i, j)$ -regular closed set and  $(i, j)$ - $\psi^*$  $\alpha$ -closed set are independent.

**Example 6.2.24** Let  $X = \{a, b, c\}$ ,  $\tau_1 = \{\phi, \{a\}, \{b\}, \{a, b\}, X\}$  and  $\tau_2 = \{\phi, \{a\}, \{a, b\}, X\}$ . Then the subset  $\{a, c\}$  is  $(1, 2)$ -regular closed but not  $(1, 2)$ - $\psi^*$  $\alpha$ -closed.

**Example 6.2.25** Let  $X = \{a, b, c\}$ ,  $\tau_1 = \{\phi, \{a\}, \{a, b\}, \{a, c\}, X\}$  and  $\tau_2 = \{\phi, \{a\}, \{b, c\}, X\}$ . Then the subset  $\{b, c\}$  is  $(1, 2)$ - $\psi^*$  $\alpha$ -closed but not  $(1, 2)$ -regular closed.

**Remark 6.2.26** The following examples show that  $(i, j)$ -semi closed set and  $(i, j)$ - $\psi^*$  $\alpha$ -closed set are independent.

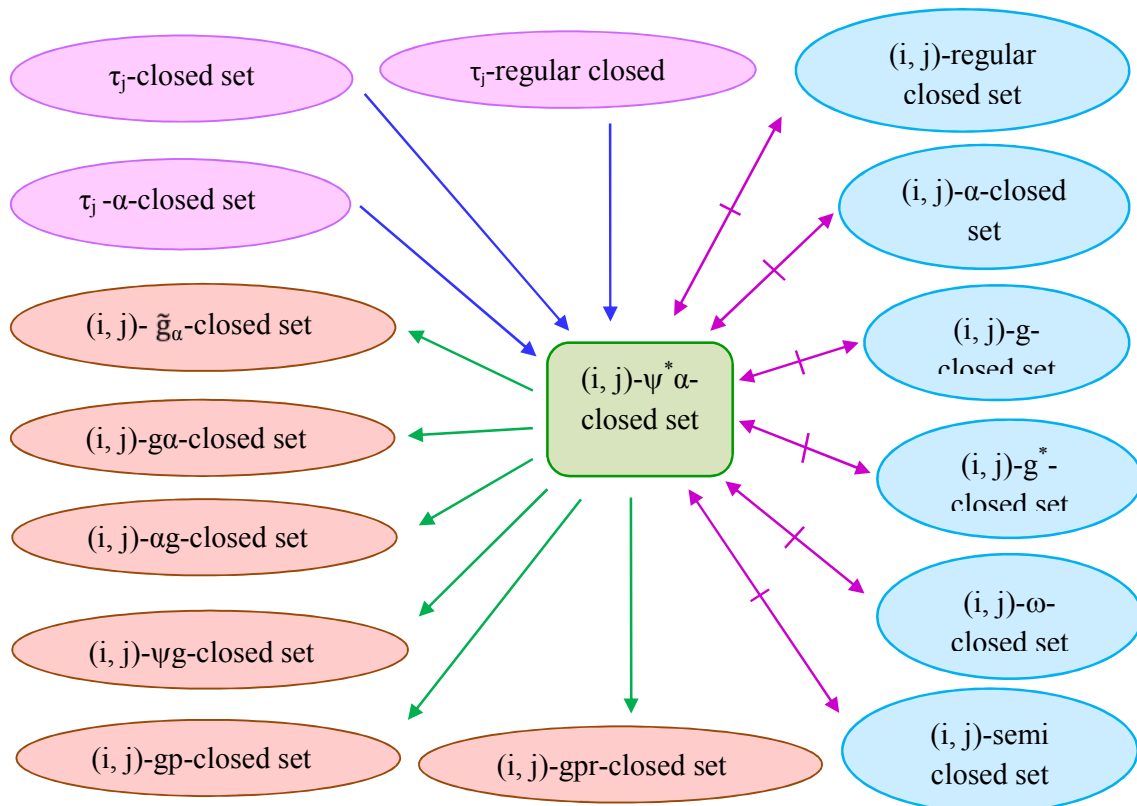

**Example 6.2.27** Let  $X = \{a, b, c\}$ ,  $\tau_1 = \{\phi, \{a\}, \{b\}, \{a, b\}, X\}$  and  $\tau_2 = \{\phi, \{a\}, X\}$ . Then the subsets  $\{a\}$  and  $\{a, c\}$  are  $(1, 2)$ -semi closed but not  $(1, 2)$ - $\psi^* \alpha$ -closed.

**Example 6.2.28** Let  $X = \{a, b, c\}$ ,  $\tau_1 = \{\phi, \{a, b\}, X\}$  and  $\tau_2 = \{\phi, \{a\}, X\}$ . Then the subsets  $\{b\}$ ,  $\{b, c\}$  and  $\{a, c\}$  are  $(1, 2)$ - $\psi^* \alpha$ -closed but not  $(1, 2)$ -semi closed.

**Remark 6.2.29** The following example show that  $(i, j)$ - $\psi^* \alpha$ -closed set is independent of  $(i, j)$ -g-closed set,  $(i, j)$ - $g^*$ -closed set and  $(i, j)$ - $\omega$ -closed set.

**Example 6.2.30** Let  $X = \{a, b, c, d\}$ ,  $\tau_1 = \{\phi, \{d\}, \{a, b\}, \{a, b, d\}, X\}$  and  $\tau_2 = \{\phi, \{a\}, X\}$ . Then the subset  $\{a, c, d\}$  is  $(1, 2)$ -g-closed,  $(1, 2)$ - $g^*$ -closed and  $(1, 2)$ - $\omega$ -closed but not  $(1, 2)$ - $\psi^* \alpha$ -closed. The subset  $\{b\}$  is  $(1, 2)$ - $\psi^* \alpha$ -closed but not  $(1, 2)$ -g-closed, not  $(1, 2)$ - $g^*$ -closed and not  $(1, 2)$ - $\omega$ -closed.

**Remark 6.2.31** The above observations are depicted in the following diagram.

**Theorem 6.2.32** If  $A$  is both  $\tau_i$ - $\psi$ g-open and  $(i, j)$ - $\psi^*$   $\alpha$ -closed in  $(X, \tau_1, \tau_2)$  then  $A$  is  $\tau_j$ - $\alpha$ -closed.

**Proof:** Let  $A$  be both  $\tau_j$ - $\psi$ g-open and  $(i, j)$ - $\psi^*$   $\alpha$ -closed. Since  $A \subseteq A$ , then  $\tau_j\text{-}\alpha\text{cl}(A) \subseteq A$ . Therefore  $\tau_j\text{-}\alpha\text{cl}(A) = A$ . Consequently  $A$  is  $\tau_j$ - $\alpha$ -closed.

**Theorem 6.2.33** If  $A$  is  $(i, j)$ - $\psi^*$   $\alpha$ -closed and  $\tau_i$ - $\psi$ g-open and  $F$  is  $\tau_j$ - $\alpha$ -closed in  $(X, \tau_1, \tau_2)$  then  $A \cap F$  is  $\tau_j$ - $\alpha$ -closed.

**Proof:** Since  $A$  is  $(i, j)$ - $\psi^*$   $\alpha$ -closed and  $\tau_i$ - $\psi$ g-open in  $(X, \tau_1, \tau_2)$ ,  $A$  is  $\tau_j$ - $\alpha$ -closed (by **Theorem 6.2.32**). Since  $F$  is  $\tau_j$ - $\alpha$ -closed,  $A \cap F$  is  $\tau_j$ - $\alpha$ -closed in  $(X, \tau_1, \tau_2)$ .

**Theorem 6.2.34** If  $A$  and  $B$  are  $(i, j)$ - $\psi^*$   $\alpha$ -closed sets, then  $A \cup B$  is also an  $(i, j)$ - $\psi^*$   $\alpha$ -closed set.

**Proof:** Let  $A$  and  $B$  be  $(i, j)$ - $\psi^*$   $\alpha$ -closed sets and  $U$  be any  $\tau_i$ - $\psi$ g-open set containing  $A \cup B$ . Then  $\tau_j\text{-}\alpha\text{cl}(A) \subseteq U$ ,  $\tau_j\text{-}\alpha\text{cl}(B) \subseteq U$ ,  $\tau_j\text{-}\alpha\text{cl}(A \cup B) = \tau_j\text{-}\alpha\text{cl}(A) \cup \tau_j\text{-}\alpha\text{cl}(B) \subseteq U$ . Hence  $A \cup B$  is  $(i, j)$ - $\psi^*$   $\alpha$ -closed.

**Remark 6.2.35** The intersection of two  $(i, j)$ - $\psi^*$   $\alpha$ -closed sets need not be  $(i, j)$ - $\psi^*$   $\alpha$ -closed as seen from the following example.

**Example 6.2.36** Let  $X = \{a, b, c, d\}$ ,  $\tau_1 = \{\emptyset, \{a\}, \{a, b\}, X\}$  and  $\tau_2 = \{\emptyset, \{d\}, \{a, b\}, \{a, b, d\}, X\}$ . Then the subsets  $A = \{a, b, c\}$  and  $B = \{b, c, d\}$  are  $(1, 2)$ - $\psi^*$   $\alpha$ -closed but their intersection  $A \cap B = \{b, c\}$  is not  $(1, 2)$ - $\psi^*$   $\alpha$ -closed.

**Theorem 6.2.37** If a subset  $A$  of a bitopological space  $(X, \tau_1, \tau_2)$  is  $(i, j)$ - $\psi^*$   $\alpha$ -closed then  $\tau_j\text{-}\alpha\text{cl}(A) - A$  contains no nonempty  $\tau_i$ - $\psi$ g-closed set.

**Proof:** Let  $A$  be an  $(i, j)$ - $\psi^*$   $\alpha$ -closed set and  $F$  be a  $\tau_i$ - $\psi$ g-closed set contained in  $\tau_j\text{-}\alpha\text{cl}(A) - A$ . Since  $F^c$  is  $\tau_i$ - $\psi$ g-open and  $A$  is  $(i, j)$ - $\psi^*$   $\alpha$ -closed,  $\tau_j\text{-}\alpha\text{cl}(A) \subseteq F^c$ . Thus  $F \subseteq [\tau_j\text{-}\alpha\text{cl}(A)]^c$ . Hence  $F \subseteq [\tau_j\text{-}\alpha\text{cl}(A)] \cap [\tau_j\text{-}\alpha\text{cl}(A)]^c = \emptyset$ . Therefore  $F = \emptyset$ . Hence  $\tau_j\text{-}\alpha\text{cl}(A) - A$  contains no nonempty  $\tau_i$ - $\psi$ g-closed set.

**Remark 6.2.38** The converse of the above theorem is not true as seen from the following example.

**Example 6.2.39** Let  $X = \{a, b, c, d\}$ ,  $\tau_1 = \{\phi, \{a, b, c\}, X\}$  and  $\tau_2 = \{\phi, \{d\}, \{a, b\}, \{a, b, d\}, X\}$ . Then  $\psi\text{GO}(X, \tau_1) = \{\phi, \{a\}, \{b\}, \{c\}, \{a, b\}, \{a, c\}, \{b, c\}, \{a, b, c\}, X\}$ ,  $\psi^*\alpha\text{C}(1, 2) = \{\phi, \{c\}, \{d\}, \{a, d\}, \{b, d\}, \{c, d\}, \{a, b, c\}, \{a, b, d\}, \{a, c, d\}, \{b, c, d\}, X\}$ . If  $A = \{a, b\}$ ,  $\tau_j\text{-}\alpha\text{cl}(A) - A = \{a, b, c\} - \{a, b\} = \{c\}$ . But  $\{a, b\}$  is not  $(1, 2)\text{-}\psi^*\alpha$ -closed.

**Theorem 6.2.40** Let  $A$  be an  $(i, j)\text{-}\psi^*\alpha$ -closed set in  $(X, \tau_1, \tau_2)$ . Then  $A$  is  $\tau_j\text{-}\alpha$ -closed if and only if  $\tau_j\text{-}\alpha\text{cl}(A) - A$  is  $\tau_i\text{-}\psi\text{g}$ -closed.

**Proof:** Suppose that  $A$  is  $(i, j)\text{-}\psi^*\alpha$ -closed. Let  $A$  be  $\tau_j\text{-}\alpha$ -closed. Then  $\tau_j\text{-}\alpha\text{cl}(A) = A$ . Therefore  $\tau_j\text{-}\alpha\text{cl}(A) - A = \phi$  is  $\tau_i\text{-}\psi\text{g}$ -closed.

Conversely, suppose that  $A$  is  $(i, j)\text{-}\psi^*\alpha$ -closed and  $\tau_j\text{-}\alpha\text{cl}(A) - A$  is  $\tau_i\text{-}\psi\text{g}$ -closed. Since  $A$  is  $(i, j)\text{-}\psi^*\alpha$ -closed  $\tau_j\text{-}\alpha\text{cl}(A) - A$  contains no nonempty  $\tau_i\text{-}\psi\text{g}$ -closed set (by **Theorem 6.2.37**). Since  $\tau_j\text{-}\alpha\text{cl}(A) - A$  is  $\tau_i\text{-}\psi\text{g}$ -closed,  $\tau_j\text{-}\alpha\text{cl}(A) - A = \phi$ . Then  $\tau_j\text{-}\alpha\text{cl}(A) = A$ . Hence  $A$  is  $\tau_j\text{-}\alpha$ -closed.

**Theorem 6.2.41** Let  $A$  and  $B$  be subsets of  $(X, \tau_1, \tau_2)$  such that  $A \subseteq B \subseteq \tau_j\text{-}\alpha\text{cl}(A)$ . If  $A$  is  $(i, j)\text{-}\psi^*\alpha$ -closed, then  $B$  is  $(i, j)\text{-}\psi^*\alpha$ -closed.

**Proof:** Let  $A$  and  $B$  be subsets such that  $A \subseteq B \subseteq \tau_j\text{-}\alpha\text{cl}(A)$ . Suppose that  $A$  is  $(i, j)\text{-}\psi^*\alpha$ -closed. Let  $B \subseteq U$  and  $U$  be  $\tau_i\text{-}\psi\text{g}$ -open in  $(X, \tau_i)$ . Then  $A \subseteq U$ . Since  $A$  is  $(i, j)\text{-}\psi^*\alpha$ -closed,  $\tau_j\text{-}\alpha\text{cl}(A) \subseteq U$ . Since  $B \subseteq \tau_j\text{-}\alpha\text{cl}(A)$ ,  $\tau_j\text{-}\alpha\text{cl}(B) \subseteq \tau_j\text{-}\alpha\text{cl}[\tau_j\text{-}\alpha\text{cl}(A)] = \tau_j\text{-}\alpha\text{cl}(A) \subseteq U$ . Therefore  $B$  is  $(i, j)\text{-}\psi^*\alpha$ -closed.

**Proposition 6.2.42** If  $A$  is an  $(i, j)\text{-}\psi^*\alpha$ -closed set, then  $\tau_i\text{-}\alpha\text{cl}(x) \cap A \neq \phi$  holds for each  $x \in \tau_j\text{-}\alpha\text{cl}(A)$ .

**Proof:** Let  $A$  be an  $(i, j)\text{-}\psi^*\alpha$ -closed set. If  $\tau_i\text{-}\alpha\text{cl}(x) \cap A = \phi$  for some  $x \in \tau_j\text{-}\alpha\text{cl}(A)$ . Then  $A \subseteq [\tau_i\text{-}\alpha\text{cl}(x)]^c$ . Since  $A$  is  $(i, j)\text{-}\psi^*\alpha$ -closed,  $\tau_j\text{-}\alpha\text{cl}(A) \subseteq [\tau_i\text{-}\alpha\text{cl}(x)]^c$ . Also since  $[\tau_i\text{-}\alpha\text{cl}(x)]^c$  is  $\tau_i\text{-}\alpha$ -open and hence  $[\tau_i\text{-}\alpha\text{cl}(x)]^c$  is  $\tau_i\text{-}\psi\text{g}$ -open. This gives  $x \notin \tau_j\text{-}\alpha\text{cl}(A)$ , which is a contradiction.

The converse of the above proposition need not be true as seen from the following example.

**Example 6.2.43** Let  $X = \{a, b, c\}$ ,  $\tau_1 = \{\phi, \{a\}, X\}$  and  $\tau_2 = \{\phi, \{a\}, \{b, c\}, X\}$ . Then the subset  $A = \{b\}$  in  $(X, \tau_1, \tau_2)$  is not  $(1, 2)$ - $\psi^* \alpha$ -closed. However  $\tau_1\text{-}\alpha\text{cl}(x) \cap A \neq \phi$  holds for each  $x \in \tau_2\text{-}\alpha\text{cl}(A)$ .

**Remark 6.2.44** In general  $\psi^* \alpha C(1, 2) \neq \psi^* \alpha C(2, 1)$  which can be seen from the following example.

**Example 6.2.45** Let  $X = \{a, b, c\}$ ,  $\tau_1 = \{\phi, \{a\}, X\}$  and  $\tau_2 = \{\phi, \{a\}, \{b\}, \{a, b\}, X\}$ . Then  $\psi^* \alpha C(1, 2) = \{\phi, \{c\}, \{b, c\}, \{a, c\}, X\}$  and  $\psi^* \alpha C(2, 1) = \{\phi, \{b\}, \{c\}, \{b, c\}, X\}$ . This shows that  $\psi^* \alpha C(1, 2) \neq \psi^* \alpha C(2, 1)$

**Theorem 6.2.46** If  $\tau_1 \subseteq \tau_2$  in  $(X, \tau_1, \tau_2)$  then  $\psi^* \alpha C(2, 1) \subseteq \psi^* \alpha C(1, 2)$ .

**Proof:** Let  $A$  be a  $(2, 1)$ - $\psi^* \alpha$ -closed set and  $U$  be any  $\tau_1$ - $\psi$ g-open set containing  $A$ . Since  $\tau_1 \subseteq \tau_2$ ,  $U$  is  $\tau_2$ - $\psi$ g-open,  $\tau_2\text{-}\alpha\text{cl}(A) \subseteq \tau_1\text{-}\alpha\text{cl}(A)$ . Thus  $\tau_2\text{-}\alpha\text{cl}(A) \subseteq U$ . Hence  $A$  is  $(1, 2)$ - $\psi^* \alpha$ -closed. That is  $A \in \psi^* \alpha C(1, 2)$ .

The converse of the above theorem need not be true as seen from the following example.

**Example 6.2.47** Let  $X = \{a, b, c\}$ ,  $\tau_1 = \{\phi, \{a\}, \{a, b\}, \{a, c\}, X\}$  and  $\tau_2 = \{\phi, \{a\}, \{b, c\}, X\}$ . Then  $\psi^* \alpha C(2, 1) \subseteq \psi^* \alpha C(1, 2)$  but  $\tau_1 \not\subseteq \tau_2$ .

### 6.3 $(i, j)$ - $\psi^* \alpha$ -closure operator

In this section,  $(i, j)$ - $\psi^* \alpha$ -closure of a set in bitopological spaces is introduced and their basic properties are analyzed.

**Definition 6.3.1** An  $(i, j)$ - $\psi^* \alpha$ -closure of a subset  $A$  of a bitopological space  $(X, \tau_1, \tau_2)$  denoted by  $(i, j)\text{-}\psi^* \alpha\text{cl}(A)$  is defined as follows:

$(i, j)\text{-}\psi^* \alpha\text{cl}(A) = \bigcap \{F \subseteq X : A \subseteq F \text{ and } F \text{ is } (i, j)\text{-}\psi^* \alpha\text{-closed in } (X, \tau_i, \tau_j)\}$ , where  $i, j = 1, 2$  and  $i \neq j$ .

**Proposition 6.3.2** Let  $E$  and  $F$  be any two subsets of  $(X, \tau_1, \tau_2)$ . Then the following results hold.

- (a)  $(i, j)\text{-}\psi^* \alpha \text{cl}(\phi) = \phi$  and  $(i, j)\text{-}\psi^* \alpha \text{cl}(X) = X$
- (b) If  $E \subseteq F$ , then  $(i, j)\text{-}\psi^* \alpha \text{cl}(E) \subseteq (i, j)\text{-}\psi^* \alpha \text{cl}(F)$
- (c)  $E \subseteq (i, j)\text{-}\psi^* \alpha \text{cl}(E) \subseteq \tau_j\text{-cl}(E)$
- (d) If  $E$  is  $(i, j)\text{-}\psi^* \alpha$ -closed in  $(X, \tau_1, \tau_2)$  then  $(i, j)\text{-}\psi^* \alpha \text{cl}(E) = E$
- (e)  $(i, j)\text{-}\psi^* \alpha \text{cl}(E \cap F) \subseteq (i, j)\text{-}\psi^* \alpha \text{cl}(E) \cap (i, j)\text{-}\psi^* \alpha \text{cl}(F)$
- (f)  $(i, j)\text{-}\psi^* \alpha \text{cl}(E \cup F) = (i, j)\text{-}\psi^* \alpha \text{cl}(E) \cup (i, j)\text{-}\psi^* \alpha \text{cl}(F)$
- (g)  $(i, j)\text{-}\psi^* \alpha \text{cl}[(i, j)\text{-}\psi^* \alpha \text{cl}(E)] = (i, j)\text{-}\psi^* \alpha \text{cl}(E)$

**Proof:**

- (a) Since  $\phi$  and  $X$  are  $(i, j)\text{-}\psi^* \alpha$ -closed in  $(X, \tau_1, \tau_2)$ , the results follows.
- (b) Let  $E \subseteq F$ . Then by the definition of  $(i, j)\text{-}\psi^* \alpha$ -closure,  $(i, j)\text{-}\psi^* \alpha \text{cl}(E) \subseteq (i, j)\text{-}\psi^* \alpha \text{cl}(F)$
- (c) From the definition of  $(i, j)\text{-}\psi^* \alpha$ -closure, it follows that  $E \subseteq (i, j)\text{-}\psi^* \alpha \text{cl}(E)$ . By **Proposition 6.2.4**, every  $\tau_j$ -closed set is  $(i, j)\text{-}\psi^* \alpha$ -closed. Therefore  $E \subseteq (i, j)\text{-}\psi^* \alpha \text{cl}(E) \subseteq \tau_j\text{-cl}(E)$
- (d) Follows from (c) and by the definition of  $(i, j)\text{-}\psi^* \alpha$ -closure.
- (e) Since  $E \cap F \subseteq E$  and  $E \cap F \subseteq F$ , by (b)  $(i, j)\text{-}\psi^* \alpha \text{cl}(E \cap F) \subseteq (i, j)\text{-}\psi^* \alpha \text{cl}(E)$ ,  $(i, j)\text{-}\psi^* \alpha \text{cl}(E \cap F) \subseteq (i, j)\text{-}\psi^* \alpha \text{cl}(F)$ . Hence  $(i, j)\text{-}\psi^* \alpha \text{cl}(E \cap F) \subseteq (i, j)\text{-}\psi^* \alpha \text{cl}(E) \cap (i, j)\text{-}\psi^* \alpha \text{cl}(F)$ .
- (f) Since  $E \subseteq E \cup F$  and  $F \subseteq E \cup F$ , by (b)  $(i, j)\text{-}\psi^* \alpha \text{cl}(E) \subseteq (i, j)\text{-}\psi^* \alpha \text{cl}(E \cup F)$  and  $(i, j)\text{-}\psi^* \alpha \text{cl}(F) \subseteq (i, j)\text{-}\psi^* \alpha \text{cl}(E \cup F)$ . Therefore  $(i, j)\text{-}\psi^* \alpha \text{cl}(E) \cup (i, j)\text{-}\psi^* \alpha \text{cl}(F) \subseteq (i, j)\text{-}\psi^* \alpha \text{cl}(E \cup F)$ . To prove the reverse inclusion, let  $x \in [(i, j)\text{-}\psi^* \alpha \text{cl}(E \cup F)]$  and suppose that  $x \notin [(i, j)\text{-}\psi^* \alpha \text{cl}(E) \cup (i, j)\text{-}\psi^* \alpha \text{cl}(F)]$ . Then  $x \notin [(i, j)\text{-}\psi^* \alpha \text{cl}(E)]$  and

$x \notin [(i, j)\text{-}\psi^* \alpha \text{cl}(F)]$ . Therefore there exist  $(i, j)\text{-}\psi^* \alpha$ -closed sets  $U$  and  $V$  such that  $E \subseteq U$ ,  $F \subseteq V$ ,  $x \notin U$  and  $x \notin V$ . Hence  $E \cup F \subseteq U \cup V$  and  $x \notin [U \cup V]$ . By **Theorem 6.2.34**,  $U \cup V$  is a  $(i, j)\text{-}\psi^* \alpha$ -closed set and hence  $x \notin [(i, j)\text{-}\psi^* \alpha \text{cl}(E \cup F)]$ , which is a contradiction. Hence  $(i, j)\text{-}\psi^* \alpha \text{cl}(E \cup F) \subseteq (i, j)\text{-}\psi^* \alpha \text{cl}(E) \cup (i, j)\text{-}\psi^* \alpha \text{cl}(F)$ . Therefore  $(i, j)\text{-}\psi^* \alpha \text{cl}(E \cup F) = (i, j)\text{-}\psi^* \alpha \text{cl}(E) \cup (i, j)\text{-}\psi^* \alpha \text{cl}(F)$ .

(g) Follows from the **Definition 6.3.1**.

**Theorem 6.3.3** The closure operator  $(i, j)\text{-}\psi^* \alpha$ -closure is a Kuratowski closure operator on  $(X, \tau_1, \tau_2)$ .

**Proof:** As  $(i, j)\text{-}\psi^* \alpha \text{cl}(\phi) = \phi$ ,  $E \subseteq (i, j)\text{-}\psi^* \alpha \text{cl}(E)$ ,  $(i, j)\text{-}\psi^* \alpha \text{cl}(E \cup F) = (i, j)\text{-}\psi^* \alpha \text{cl}(E) \cup (i, j)\text{-}\psi^* \alpha \text{cl}(F)$  and  $(i, j)\text{-}\psi^* \alpha \text{cl}[(i, j)\text{-}\psi^* \alpha \text{cl}(E)] = (i, j)\text{-}\psi^* \alpha \text{cl}(E)$ ,  $(i, j)\text{-}\psi^* \alpha$ -closure is a Kuratowski closure operator on  $(X, \tau_1, \tau_2)$ .

#### 6.4 $(i, j)\text{-}\psi^* \alpha$ -open sets

In this section,  $(i, j)\text{-}\psi^* \alpha$ -open sets in bitopological spaces is introduced and their properties are studied.

**Definition 6.4.1** A subset  $A$  of a bitopological space  $(X, \tau_1, \tau_2)$  is called  **$(i, j)\text{-}\psi^* \alpha$ -open** if its complement is  $(i, j)\text{-}\psi^* \alpha$ -closed in  $(X, \tau_1, \tau_2)$ .

The family of all  $(i, j)\text{-}\psi^* \alpha$ -open sets in  $(X, \tau_1, \tau_2)$  is denoted by  $\psi^* \alpha \mathbf{O}(i, j)$ .

**Example 6.4.2** Let  $X = \{a, b, c\}$ ,  $\tau_1 = \{\phi, \{a\}, X\}$  and  $\tau_2 = \{\phi, \{a\}, \{b\}, \{a, b\}, X\}$ . Then  $\phi$ ,  $\{a\}, \{b\}, \{a, b\}$  are  $(1, 2)\text{-}\psi^* \alpha$ -open.

**Definition 6.4.3** An  **$(i, j)\text{-}\psi^* \alpha$ -interior of a subset  $A$**  of a bitopological space  $(X, \tau_1, \tau_2)$  denoted by  **$(i, j)\text{-}\psi^* \alpha \text{int}(A)$**  is defined as follows:

$(i, j)\text{-}\psi^* \alpha \text{int}(A) = \cup \{F \subseteq X : F \subseteq A \text{ and } F \text{ is } (i, j)\text{-}\psi^* \alpha\text{-open in } (X, \tau_i, \tau_j)\}$ , where  $i, j = 1, 2$  and  $i \neq j$ .

**Proposition 6.4.4** In a bitopological space  $(X, \tau_1, \tau_2)$  the following statements are true.

- (i) Every  $\tau_j$ -open set is  $(i, j)$ - $\psi^*$   $\alpha$ -open.
- (ii) Every  $\tau_j$ - $\alpha$ -open set is  $(i, j)$ - $\psi^*$   $\alpha$ -open.
- (iii) Every  $\tau_j$ -regular open set is  $(i, j)$ - $\psi^*$   $\alpha$ -open.
- (iv) Every  $(i, j)$ - $\psi^*$   $\alpha$ -open set is  $(i, j)$ -gp-open.
- (v) Every  $(i, j)$ - $\psi^*$   $\alpha$ -open set is  $(i, j)$ -gpr-open.
- (vi) Every  $(i, j)$ - $\psi^*$   $\alpha$ -open set is  $(i, j)$ - $\tilde{g}_\alpha$ -open.
- (vii) Every  $(i, j)$ - $\psi^*$   $\alpha$ -open set is  $(i, j)$ -g $\alpha$ -open.
- (viii) Every  $(i, j)$ - $\psi^*$   $\alpha$ -open set is  $(i, j)$ - $\alpha$ g-open.
- (ix) Every  $(i, j)$ - $\psi^*$   $\alpha$ -open set is  $(i, j)$ - $\psi$ g-open.

The converse of the statements in the above proposition are not true in general as seen from the examples 6.2.5, 6.2.6, 6.2.7, 6.2.9, 6.2.11, 6.2.13, 6.2.15, 6.2.17 and 6.2.19 by considering their respective open sets.

**Theorem 6.4.5** A subset  $A$  of a bitopological space  $(X, \tau_1, \tau_2)$  is  $(i, j)$ - $\psi^*$   $\alpha$ -open if and only if  $F \subseteq \tau_j$ - $\alpha$ int( $A$ ) whenever  $F \subseteq A$  and  $F$  is  $\tau_i$ - $\psi$ g-closed in  $(X, \tau_1, \tau_2)$

**Proof:** Suppose that  $A$  is  $(i, j)$ - $\psi^*$   $\alpha$ -open. Let  $F \subseteq A$  and  $F$  be  $\tau_i$ - $\psi$ g-closed. Then  $A^c \subseteq F^c$  and  $F^c$  is  $\tau_i$ - $\psi$ g-open. Since  $A^c$  is  $(i, j)$ - $\psi^*$   $\alpha$ -closed,  $\tau_j$ - $\alpha$ cl( $A^c$ )  $\subseteq F^c$ . Since  $\tau_j$ - $\alpha$ cl( $A^c$ ) =  $\tau_j$ - $(\alpha$ int( $A$ )) $^c$ ,  $\tau_j$ - $(\alpha$ int( $A$ )) $^c \subseteq F^c$ . Hence  $F \subseteq \tau_j$ - $\alpha$ int( $A$ ).

Conversely, suppose that  $F \subseteq \tau_j$ - $\alpha$ int( $A$ ) whenever  $F \subseteq A$  and  $F$  is  $\tau_i$ - $\psi$ g-closed in  $(X, \tau_1, \tau_2)$ . Let  $U$  be  $\tau_i$ - $\psi$ g-open and  $A^c \subseteq U$ . Then  $U^c$  is  $\tau_i$ - $\psi$ g-closed and  $U^c \subseteq A$ . Hence by assumption  $U^c \subseteq \tau_j$ - $\alpha$ int( $A$ ). Therefore  $\tau_j$ - $(\alpha$ int( $A$ )) $^c \subseteq U$ . That is  $\tau_j$ - $\alpha$ cl( $A^c$ )  $\subseteq U$ . Therefore  $A^c$  is  $(i, j)$ - $\psi^*$   $\alpha$ -closed. Hence  $A$  is  $(i, j)$ - $\psi^*$   $\alpha$ -open.

**Theorem 6.4.6** If a subset  $A$  is  $(i, j)$ - $\psi^*$   $\alpha$ -closed in  $(X, \tau_1, \tau_2)$ , then  $\tau_j$ - $\alpha$ cl( $A$ ) -  $A$  is  $(i, j)$ - $\psi^*$   $\alpha$ -open.

**Proof:** Suppose that  $A$  is  $(i, j)$ - $\psi^*$   $\alpha$ -closed in  $(X, \tau_1, \tau_2)$ . Let  $F \subseteq \tau_j$ - $\alpha$ cl( $A$ ) -  $A$  and  $F$  be  $\tau_i$ - $\psi$ g-closed. Since  $A$  is  $(i, j)$ - $\psi^*$   $\alpha$ -closed,  $\tau_j$ - $\alpha$ cl( $A$ ) -  $A$  does not contain nonempty  $\tau_i$ - $\psi$ g-closed set (by **Theorem 6.2.37**). Hence  $F = \phi$ . Thus  $F \subseteq \tau_j$ - $\alpha$ int[ $\tau_j$ - $\alpha$ cl( $A$ ) -  $A$ ]. Hence  $\tau_j$ - $\alpha$ cl( $A$ ) -  $A$  is  $(i, j)$ - $\psi^*$   $\alpha$ -open.

**Theorem 6.4.7** If a set  $A$  is  $(i, j)$ - $\psi^*$   $\alpha$ -open in  $(X, \tau_1, \tau_2)$  then  $G = X$  whenever  $G$  is  $\tau_1$ - $\psi$ g-open and  $\tau_j$ - $\alpha$ int( $A$ )  $\cup$   $A^c \subseteq G$ .

**Proof:** Suppose that  $A$  is  $(i, j)$ - $\psi^*$   $\alpha$ -open in  $(X, \tau_1, \tau_2)$ ,  $G$  is  $\tau_1$ - $\psi$ g-open and  $\tau_j$ - $\alpha$ int( $A$ )  $\cup$   $A^c \subseteq G$ . Then  $G^c \subseteq \{\tau_j$ - $\alpha$ int( $A$ )  $\cup$   $A^c\}^c = \tau_j$ - $\alpha$ cl( $A^c$ )  $-$   $A^c$ . Since  $A^c$  is  $(i, j)$ - $\psi^*$   $\alpha$ -closed,  $\tau_j$ - $\alpha$ cl( $A^c$ )  $-$   $A^c$  contains no nonempty  $\tau_1$ - $\psi$ g-closed set in  $(X, \tau_1, \tau_2)$  (by **Theorem 6.2.37**). Therefore  $G^c = \phi$ . Hence  $G = X$ .

**Remark 6.4.8** The converse of the above theorem is not true in general as seen from the following example.

**Example 6.4.9** Let  $X = \{a, b, c\}$ ,  $\tau_1 = \{\phi, \{a\}, X\}$  and  $\tau_2 = \{\phi, \{a, b\}, X\}$ . Let  $A = \{c\}$  and  $G = X$ . Then  $G$  is  $\tau_1$ - $\psi$ g-open,  $\tau_2$ - $\alpha$ int( $A$ )  $\cup$   $A^c = \phi \cup \{a, b\} = \{a, b\} \subseteq G$ , but  $A = \{c\}$  is not  $(1, 2)$ - $\psi^*$   $\alpha$ -open.

**Theorem 6.4.10** Let  $(X, \tau_1, \tau_2)$  be a bitopological space. If  $x \in X$ , then singleton  $\{x\}$  is either  $\tau_1$ - $\psi$ g-closed or  $(i, j)$ - $\psi^*$   $\alpha$ -open.

**Proof:** Let  $x \in X$  and suppose that  $\{x\}$  is not  $\tau_1$ - $\psi$ g-closed. Then  $X - \{x\}$  is not  $\tau_1$ - $\psi$ g-open. Consequently,  $X$  is the only  $\tau_1$ - $\psi$ g-open set containing the set  $X - \{x\}$ . Therefore  $\tau_1$ - $\alpha$ cl( $X - \{x\}$ )  $\subseteq X$  and so  $X - \{x\}$  is  $(i, j)$ - $\psi^*$   $\alpha$ -closed. Hence  $\{x\}$  is  $(i, j)$ - $\psi^*$   $\alpha$ -open.

### 6.5 Applications of $(i, j)$ - $\psi^*$ $\alpha$ -closed sets

As an application of  $(i, j)$ - $\psi^*$   $\alpha$ -closed set, four new spaces namely,  $(i, j)$ - $\psi^*$   $T_c$ -space,  $(i, j)$ - $\psi^*$   $T_\alpha$ -space,  $(i, j)$ - $g_\alpha T_{\psi^* \alpha}$ -space and  $(i, j)$ - $ag T_{\psi^* \alpha}$ -space are introduced and their interrelations are studied.

**Definition 6.5.1** A bitopological space  $(X, \tau_1, \tau_2)$  is called an

- (i)  **$(i, j)$ - $\psi^*$   $T_c$ -space** if every  $(i, j)$ - $\psi^*$   $\alpha$ -closed subset of  $(X, \tau_1, \tau_2)$  is  $\tau_j$ -closed in  $X$ .
- (ii)  **$(i, j)$ - $\psi^*$   $T_\alpha$ -space** if every  $(i, j)$ - $\psi^*$   $\alpha$ -closed subset of  $(X, \tau_1, \tau_2)$  is  $\tau_j$ - $\alpha$ -closed in  $X$ .

- (iii) **(i, j)- $\text{g}\alpha\text{T}_{\psi^*\alpha}$ -space** if every (i, j)- $\text{g}\alpha$ -closed subset of  $(X, \tau_1, \tau_2)$  is (i, j)- $\psi^*\alpha$ -closed in  $(X, \tau_1, \tau_2)$
- (iv) **(i, j)- $\alpha\text{gT}_{\psi^*\alpha}$ -space** if every (i, j)- $\alpha\text{g}$ -closed subset of  $(X, \tau_1, \tau_2)$  is (i, j)- $\psi^*\alpha$ -closed in  $(X, \tau_1, \tau_2)$

**Remark 6.5.2** Every  $(i, j)\text{-}\psi^*\alpha\text{T}_c$ -space is an  $(i, j)\text{-}\psi^*\alpha\text{T}_\alpha$ -space but not conversely.

**Example 6.5.3** Let  $X = \{a, b, c\}$ ,  $\tau_1 = \{\phi, \{a\}, \{b, c\}, X\}$  and  $\tau_2 = \{\phi, \{a\}, \{a, b\}, X\}$ . Then  $(X, \tau_1, \tau_2)$  is an  $(i, j)\text{-}\psi^*\alpha\text{T}_\alpha$ -space but not an  $(i, j)\text{-}\psi^*\alpha\text{T}_c$ -space, since the subset  $\{b\}$  is  $(1, 2)\text{-}\psi^*\alpha$ -closed but not  $\tau_2$ -closed.

**Remark 6.5.4** Every  $(i, j)\text{-}\alpha\text{gT}_{\psi^*\alpha}$ -space is an  $(i, j)\text{-g}\alpha\text{T}_{\psi^*\alpha}$ -space but not conversely.

**Example 6.5.5** Let  $X = \{a, b, c\}$ ,  $\tau_1 = \{\phi, \{a\}, X\}$  and  $\tau_2 = \{\phi, \{a\}, \{b\}, \{a, b\}, \{a, c\}, X\}$ . Then  $(X, \tau_1, \tau_2)$  is an  $(i, j)\text{-g}\alpha\text{T}_{\psi^*\alpha}$ -space but not an  $(i, j)\text{-}\alpha\text{gT}_{\psi^*\alpha}$ -space, since the subset  $\{a, b\}$  is  $(1, 2)\text{-}\alpha\text{g}$ -closed but not  $(1, 2)\text{-}\psi^*\alpha$ -closed in  $(X, \tau_1, \tau_2)$ .

**Remark 6.5.6** The following examples show that  $(i, j)\text{-}\psi^*\alpha\text{T}_c$ -space is independent of  $(i, j)\text{-g}\alpha\text{T}_{\psi^*\alpha}$ -space and  $(i, j)\text{-}\alpha\text{gT}_{\psi^*\alpha}$ -space.

**Example 6.5.7** Let  $X = \{a, b, c\}$ ,  $\tau_1 = \{\phi, \{a\}, \{b\}, \{a, b\}, X\}$  and  $\tau_2 = \{\phi, \{a\}, \{b, c\}, X\}$ . Then  $(X, \tau_1, \tau_2)$  is an  $(i, j)\text{-}\psi^*\alpha\text{T}_c$ -space but not an  $(i, j)\text{-g}\alpha\text{T}_{\psi^*\alpha}$ -space and  $(i, j)\text{-}\alpha\text{gT}_{\psi^*\alpha}$ -space, since the subset  $\{a, c\}$  is  $(1, 2)\text{-g}\alpha$ -closed and  $(1, 2)\text{-}\alpha\text{g}$ -closed but not  $(1, 2)\text{-}\psi^*\alpha$ -closed in  $(X, \tau_1, \tau_2)$ .

**Example 6.5.8** Let  $X = \{a, b, c\}$ ,  $\tau_1 = \{\phi, \{a\}, \{b\}, \{a, b\}, \{a, c\}, X\}$  and  $\tau_2 = \{\phi, \{a\}, X\}$ . Then  $(X, \tau_1, \tau_2)$  is an  $(i, j)\text{-g}\alpha\text{T}_{\psi^*\alpha}$ -space and an  $(i, j)\text{-}\alpha\text{gT}_{\psi^*\alpha}$ -space but not an

$(i, j)$ - $\psi^*\alpha$  $T_c$ -space, since the subsets  $\{b\}$  and  $\{c\}$  are  $(1, 2)$ - $\psi^*\alpha$ -closed in  $(X, \tau_1, \tau_2)$  but not  $\tau_2$ -closed.

**Remark 6.5.9** The following examples show that  $(i, j)$ - $\psi^*\alpha T_\alpha$ -space is independent of  $(i, j)$ - $g\alpha T_{\psi^*\alpha}$ -space and  $(i, j)$ - $\alpha g T_{\psi^*\alpha}$ -space.

**Example 6.5.10** Let  $X = \{a, b, c\}$ ,  $\tau_1 = \{\phi, \{a\}, \{b\}, \{a, b\}, X\}$  and  $\tau_2 = \{\phi, \{a\}, \{b, c\}, X\}$ . Then  $(X, \tau_1, \tau_2)$  is an  $(i, j)$ - $\psi^*\alpha T_\alpha$ -space but not an  $(i, j)$ - $g\alpha T_{\psi^*\alpha}$ -space and  $(i, j)$ - $\alpha g T_{\psi^*\alpha}$ -space, since the subset  $\{a, c\}$  is  $(1, 2)$ - $g\alpha$ -closed and  $(1, 2)$ - $\alpha g$ -closed but not  $(1, 2)$ - $\psi^*\alpha$ -closed in  $(X, \tau_1, \tau_2)$ .

**Example 6.5.11** Let  $X = \{a, b, c\}$ ,  $\tau_1 = \{\phi, \{a, b\}, X\}$  and  $\tau_2 = \{\phi, \{a\}, \{a, b\}, X\}$ . Then  $(X, \tau_1, \tau_2)$  is an  $(i, j)$ - $g\alpha T_{\psi^*\alpha}$ -space and  $(i, j)$ - $\alpha g T_{\psi^*\alpha}$ -space but not an  $(i, j)$ - $\psi^*\alpha T_\alpha$ -space, since the subsets  $\{b\}$  and  $\{a, c\}$  are  $(1, 2)$ - $\psi^*\alpha$ -closed in  $(X, \tau_1, \tau_2)$  but not  $\tau_2$ - $\alpha$ -closed.

**Remark 6.5.12** The above results are given in the following diagram.

**Theorem 6.5.13** For a space  $(X, \tau_1, \tau_2)$  the following statements are equivalent

(i)  $(X, \tau_1, \tau_2)$  is an  $(i, j)$ - $\psi^*\alpha T_\alpha$ -space

(ii) For each  $x \in X$ ,  $\{x\}$  is either  $\tau_i$ - $\psi g$ -closed or  $\tau_j$ - $\alpha$ -open, for  $i \neq j$ .

**Proof:** (i)  $\Rightarrow$  (ii) Suppose that  $\{x\}$  is not a  $\tau_i$ - $\psi$ g-closed subset for some  $x \in X$ . Then  $X - \{x\}$  is not  $\tau_i$ - $\psi$ g-open and hence  $X$  is the only  $\tau_i$ - $\psi$ g-open set containing  $X - \{x\}$ . This implies that  $X - \{x\}$  is  $(i, j)$ - $\psi^*$  $\alpha$ -closed. Since  $(X, \tau_1, \tau_2)$  is an  $(i, j)$ - $\psi^*$  $T_\alpha$ -space,  $X - \{x\}$  is  $\tau_j$ - $\alpha$ -closed or equivalently  $\{x\}$  is  $\tau_j$ - $\alpha$ -open.

(ii)  $\Rightarrow$  (i) Let  $A$  be an  $(i, j)$ - $\psi^*$  $\alpha$ -closed set in  $(X, \tau_1, \tau_2)$  and  $x \in \tau_j$ - $\text{acl}(A)$ . We show that  $x \in A$ . By (ii),  $\{x\}$  is either  $\tau_i$ - $\psi$ g-closed or  $\tau_j$ - $\alpha$ -open.

**Case 1:** Assume that  $\{x\}$  is  $\tau_j$ - $\alpha$ -open. Then  $X - \{x\}$  is  $\tau_j$ - $\alpha$ -closed. If  $x \notin A$ , then  $A \subseteq X - \{x\}$ . Since  $x \in \tau_j$ - $\text{acl}(A)$  and  $x \in X - \{x\}$ , it is a contradiction. Hence  $x \in A$ .

**Case 2:** Assume that  $\{x\}$  is  $\tau_i$ - $\psi$ g-closed and  $x \notin A$ . Then  $\tau_j$ - $\text{acl}(A) - A$  contains a  $\tau_i$ - $\psi$ g-closed set  $\{x\}$ . This contradicts **Theorem 6.2.37**. Therefore  $x \in A$ .
