**Chapter I**  
**INTRODUCTION**

**Agriculture is the soul of the country's economy, and organic agriculture is its backbone.**

Agriculture, commonly referred to as farming, is a form of art and science and contributes a major part in reshaping a part of our Earth in terms of cultivating and harvesting plants and crops, and providing a suitable environment for livestock for their growth, wellness of humans and economic gain. Human lifestyles without agriculture cannot be considered, as it affords fundamental necessities like meals for us to live a healthy life. Hence, it increases the importance of agronomical culture in our lives. Agriculture is said to be a significant sector of Indian livelihood and economy. Agriculture or farming has contributed to almost 17% of the total Gross Domestic Product (GDP) and over 60% of the population is employed in agriculture. Indian agriculture has been noted for remarkable growth over the past few decades (Nawaz and Farooq, 2021).

According to Barrett (2021), agriculture is a major productive unit that integrates nature's gifts such as land, air, light, rainwater, temperature, humidity and others into a single primary unit. This primary unit is very crucial for human beings. After feeding on these fundamental units, the secondary producing units consist of animals, poultry, birds, and insects that may produce concentrated end products like meat, milk, eggs, honey, wool, hide, silk, and lac, among other things. Food, fuel, fiber, furniture, raw resources and waste products for and from industry, money, and flood control are all provided by agriculture. An atmosphere of freedom, justice, and freshness; plenty of food preventing starvation; and arguments that end in camaraderie. Together with these factors, it also takes into account the creation of jobs, economics, education, ecology, energy consumption, equipment use, earning for production, protection, processing, consumption, preservation, and the fight against waste, as well as commerce and transportation. Draft power, agricultural machinery, irrigation water, fertilizers, manures, chemicals (pesticides, herbicides, growth hormones), and electricity for preservation are the cultural energies of production.
